Assessment of Qualification for Treatment under the Arizona Natural and Exceptional Events Policy for the High Particulate (PM₁₀) Concentration Events in the Nogales, Arizona Area on November 19, 2007

Background

The Arizona Department of Environmental Quality (ADEQ) operates monitors at the Post Office in Nogales, Arizona for PM₁₀ and PM_{2.5} and at the Fire Station in Nogales, Sonora for PM₁₀. Federal Reference Method (FRM) filter-based samples are collected at both locations. Beta-Attenuation Monitor Systems (BAMS) collect hourly concentration data at the Post Office site.

During the evening of November 19, 2007, a strong night-time temperature inversion set up in the Nogales area. With no significant ventilating winds available to break up the surface inversion, the inversion intensified and set up a drainage flow from the higher terrain to the south in Mexico through Nogales, Sonora, and into Nogales, Arizona.

The event brought significant elevated ambient concentrations of PM₁₀ that exceeded the National Ambient Air Quality Standards (NAAQS) at the ADEQ Nogales

Post Office monitors (BAMS). The fact that ambient concentrations exceed the NAAQS satisfies the criteria in 40 CFR 50.1(j) that the event “affects air quality.”

Preliminary indications were that emissions from sources in Mexico, which are not subject to control by the Arizona state implementation plan (SIP), may have contributed to the event.

A PM₁₀ SIP exists for Nogales, Arizona. All appropriate SIP control measures were in place during the event demonstrating, per 40 CFR 50.1(j), that the event “is not reasonably controllable or preventable,” if in fact emissions from Mexico caused the exceedance.

Elevated PM₁₀ and PM_{2.5} concentrations were measured in the Nogales area. The following are the key PM monitor readings for the monitors examined in this report:

| Monitor (Operator/Type) | AQS ID* | 24-hr Avg PM ₁₀ or PM _{2.5} | 1-hr Max PM ₁₀ or PM _{2.5} | Time of Max 1-hr | Flag** |
|---|------------------------|--|---|---------------------|-----------|
| NOGALES AREA | | | | | |
| Nogales AZ Post Office PM₁₀ (ADEQ/BAM) | 04-023-0004 (3) | 177 | 510 | 1800 | RL |
| Nogales AZ Post Office PM_{2.5} (ADEQ/BAM) | 04-023-0004 (3) | 21.3 | 51 | 1800 | None |

* EPA Air Quality System Identification Number

** 24-hr PM₁₀ concentration influenced by exceptional event (international transport) to be flagged.

Type Abbreviations: BAM – Beta-Attenuation Mass Monitor (Continuous monitor)

The preliminary findings from this analysis were presented at a stakeholders meeting on June 11, 2008, in Phoenix, Arizona, and on June 17, 2008, in Nogales, Arizona. Public comment was solicited on the preliminary findings from May 28 through June 26, 2008. During that time, no comments were received from the public. ADEQ has

finalized this demonstration, which was made available for public comment from August 11, 2008, through September 10, 2008. Any comments that were received were forwarded to EPA with this demonstration pursuant to 40 CFR 50.14(c)(3)(i).

SUMMARY OF EVENT
 Drainage flow set up after sunset on the evening of 11/19 bringing heavy dust from Mexico into the United States that impacted the Nogales Post Office Monitor operated by ADEQ. Lack of high PM_{2.5} confirms the impact was dust vs smoke.

Assessment Under the Technical Criteria Document (TCD)

1. Properly qualify and validate the air quality measurement to be flagged. As this was not a filter sampling date (1-in-6 run day), only data from the continuous analyzers were examined. The air quality monitoring data were reviewed by ADEQ, the agency responsible for operation of the monitor. All hourly PM₁₀ and PM_{2.5} readings from the Nogales BAMS monitors were found to be valid for November 19th. No specific local sources were reported as significantly contributing to the air quality episode.

2. Review suspected contributing sources. The event began on the evening of November 19th. There was not a significant fraction of PM_{2.5} measured during this episode. This is typical for the arid southwest, except when smoke from smoldering fires can be a significant source of PM_{2.5}. Lack of any significant transport winds would indicate that the emissions are from nearby the monitor. The plot of hourly PM₁₀ concentration data in the upper right corner of Figure 1, in conjunction with the wind direction data, confirms the identical timing of the transport from the south across the U.S. / Mexico border when the elevated PM concentrations began. It is clear from the PM_{2.5} data presented in the table in the Background section of this report that smoke was not a major contributor to this event.

3. Examine all air quality monitoring information. Data from all monitors in the network were reviewed. Monitors from the Nogales area are summarized in the table in the Background section of this assessment. Pursuant to 40 CFR 50.14(c)(3)(iii)(C), the "Historical Distribution" Table in Figure 1 has been included to demonstrate that the event is associated with measured concentrations in excess of normal historical fluctuations, including background (i.e., concentrations greater than the 95th percentile).

4. Examine the meteorological conditions before and during the event. Figure 1 includes a map showing the terrain and drainage patterns of the Nogales area. Cold air forming in the mountains south of the U.S. / Mexico border will flow northward into the Santa Cruz River Drainage Basin. National Weather Service data from the Nogales

Airport, northeast of the city, showed calm to light and variable winds in the evening hours from the east or south. The data from ADEQ's wind monitor are included in the PM daily report sheet (see attachments). At the Post Office, winds shifted to being from the south at approximately 5:00 p.m. at 1-2 miles per hour. The concentrations picked up on the evening of November 19th when the winds shifted and started moving out of the south. It appears the source is coming from Mexico, since there are no sources in the United States between the monitor and the border.

5. Perform a qualitative attribution to emission source(s). All evidence indicates the elevated PM₁₀ and PM_{2.5} concentrations in the Nogales, Arizona, area can be attributed to dust emissions from sources south of Nogales, Arizona, in Nogales, Sonora. The data available for this analysis do not allow for development of a source-specific emission allocation. The hourly concentration data do not show any significant source other than the drainage dust and smoke associated with the event.

6. Estimation of Contribution from Source or Event. The primary source appears to be drainage dust from Mexico for which there is no effective or efficient method to estimate the relative contributions from specific sources. The demonstration analysis contained in this report establishes the linkage between the measurements to be flagged and the event, thus satisfying the requirement in 40 CFR 50.14(c)(3)(iii)(B). Pursuant to 40 CFR 50.14(c)(3)(iii)(D), the "Event Contrib. Analysis" Table in Figure 1 has been included to demonstrate that there would have been no exceedances or violations but for the event (i.e., the contribution during the event overwhelmed the 24-hour average).

7. Determination that a Natural or Exceptional Event Contributed To an Exceedance. Based on this analysis, the event satisfies the requirement in 40 CFR 50.1(j) that the elevated concentration at the Nogales Post Office monitor was attributed to an exceptional event caused by international transport of emissions into the United States.

Conclusion

International transport of emissions. The elevated PM₁₀ event on November 19, 2007, in Nogales, Arizona was the result of emissions from Mexico which were transported into the United States in a slow moving drainage flow originating in the mountains south of Nogales, Sonora.

The fact that all appropriate SIP control measures were in place and emissions from international transport caused the exceedance demonstrates that, per 40 CFR 50.1(j), that the event "is not reasonably controllable or preventable."

The "other" flag (RL) was applied to the PM₁₀ measurements, as the monitors would have been below the NAAQS but for the contribution of the event.
