REMEDIAL INVESTIGATION REPORT

EAST CENTRAL PHOENIX 40th STREET AND INDIAN SCHOOL ROAD WATER QUALITY ASSURANCE REVOLVING FUND SITE PHOENIX, ARIZONA

EXECUTIVE SUMMARY

This report summarizes the findings of the remedial investigation (RI) activities conducted by the Arizona Department of Environmental Quality at the 40th Street and Indian School Road site (the Site) of the East Central Phoenix (ECP) Water Quality Assurance Revolving Fund area located in Phoenix, Arizona. Hargis + Associates, Inc. prepared the draft RI Report to meet the requirements established under the Arizona Revised Statutes to characterize the nature and extent of contaminants of concern (COCs) in the subsurface and determine the need for appropriate cleanup actions at the Site. Tetrachloroethene (PCE) has been identified as the COC at the Site. However, trichloroethene (TCE) has been historically detected in Site area media.

The Site is located in the 4000 block of East Indian School Road in a mixed residential and commercial area of Phoenix, Arizona (Figure 1). The Site is one of six ECP WQARF sites. The current site is bounded by Devonshire Avenue to the North, 40th Street to the East, East Picadilly Road to the South and 38th Place to the West.

The Site is located in the western portion of the Salt River Valley. The alluvial sediments beneath the site are subdivided into three hydrologic units: the Upper, Middle, and Lower Alluvial Units (UAU, MAU, and LAU) (ADWR, 1993). The total thickness of alluvial sediments is estimated to be less than 250 feet thick in the vicinity of the Site, which lies near the edge of the alluvial basin. The MAU is believed to be absent in the vicinity of the Site. Twenty-five groundwater monitor wells have been installed at 18 locations in the vicinity of the Site to a maximum depth of approximately 145 feet below land surface (bls) within the UAU.

EXECUTIVE SUMMARY (continued)

The base of the UAU has not been encountered during drilling activities to date; however, it has been reported that the UAU ranges in thickness from approximately 125 to 300 feet in the ECP area. The UAU consists of predominantly fine-grained clayey silts and silt with sand to sandy silts with trace amounts of gravel.

The depth to water at the Site had ranged from approximately 21 feet bls in the mid 1990's to approximately 49 feet bls in 2014. The direction of groundwater flow is southwest with a gradient ranging from 0.005 to 0.008. Vertical gradients between the shallow and deeper zones of the UAU are generally negligible. In the vicinity of the Site, estimates of horizontal hydraulic conductivity of the UAU range between 1.3 foot/day to 67 feet/day.

Investigations began in the early 1980's when groundwater contamination was discovered in water wells in East Central Phoenix. Preliminary Responsible Party searches identified numerous potential sources of VOCs including several dry cleaning facilities. In 1989 soil vapor samples collected adjacent to former Allen's Cleaners and Kachina Cleaners detected PCE at 370 µg/L and 270 µg/L respectively. Between 1989 and 2008, numerous investigations and remedial activities were performed at former Allen's Cleaners and Kachina Cleaners in connection with the presence of PCE and TCE in the subsurface. Tasks performed during the investigations included various soil/soil vapor investigations and the installation of 15 monitor wells. Additional tasks included: aquifer testing, sludge sampling and monitor well rehabilitation.

Remedial activities performed at the former Allen's Cleaners included: sump excavation and the operation of a soil vapor extraction/air sparging (SVE/AS) system. A minimum of 33 pounds of PCE were removed during the operation of the SVE system between 2004 and 2005 at the former Allen's Cleaners; the system was removed in 2005. The most recent (2006) soil vapor sampling performed at Kachina Cleaners detected PCE at concentrations greater than the commercial screening level. No soil remedial activities, such as SVE and or soil excavations, have been performed at Kachina Cleaners. However, potential sources of contamination, including dry cleaning equipment, may have been removed. Due to budget constraints, between 2008 and 2011, investigation and remedial activities were temporarily suspended, but resumed in 2012.

ES-2

EXECUTIVE SUMMARY (continued)

In 2013 and 2014, RI activities at the Site included monitoring existing monitor wells and installation and sampling of ten (10) additional paired groundwater monitor wells at five (5) locations downgradient of Kachina Cleaners facility and the former Allen's Cleaners. In 2013 and 2014, PCE was detected in six (6) of 23 monitor wells sampled ranging in concentration from 1.0 μ g/L to 20 μ g/L, with PCE concentrations above the Aquifer Water Quality Standard (AWQS) of 5 μ g/L were detected in monitor wells AMW-08 and KMW-01. In 2013 and 2014, TCE was detected in one (1) of 23 monitor wells sampled at the concentration of 1.9 μ g/L, below the AWQS of 5 μ g/L; TCE has not been detected at or above the AWQS of 5 μ g/L since 2004.

Historically, the highest detections of PCE in groundwater have been at the four monitor wells located next to and immediately downgradient of the dry cleaning sources. The highest concentrations of PCE in groundwater were detected between 1992 and the early 2000s. Significant declines in PCE concentrations have been observed between the early 2000's to approximately 2006, most likely a result of operating the SVE/AS treatment system. Since 2006, the decline in PCE concentrations has slowed down. During the time period with the highest PCE detections, 1992 to 2006, the furthest downgradient well from both facilities was KMW-01, located just 50 feet downgradient from Kachina Cleaners.

Historically, concentrations of TCE in groundwater greater than the AWQS were detected between 1992 and 2004 and only from monitor wells AMW-01, AMW-06 and KMW-01. From the early 2000's to approximately 2006, TCE concentrations declined significantly. The highest concentrations of TCE, up to 490 μ g/L, were detected from AMW-01, located next to and downgradient of former Allen's Cleaners.

Currently the horizontal extent of PCE above the AWQS has been identified as an area downgradient of the former Allen's Cleaners, extending beneath and slightly downgradient of Kachina Cleaners. The vertical extent of PCE above the AWQS has been identified to be within the upper 11 feet of the water table. Currently TCE concentrations in groundwater are below the AWQS.

EXECUTIVE SUMMARY (continued)

It is recommended that the Site groundwater monitor wells remain in the ECP WQARF well network to be monitored quarterly to provide water level data and to verify the continued attenuation of PCE in the subsurface. Additionally, semi-annual soil vapor monitoring should be conducted in the following fiscal year to verify the sources in the vadose zone remain at diminished levels.

REMEDIAL INVESTIGATION REPORT

EAST CENTRAL PHOENIX 40th STREET AND INDIAN SCHOOL ROAD WATER QUALITY ASSURANCE REVOLVING FUND SITE PHOENIX, ARIZONA

1.0 INTRODUCTION

Hargis + Associates, Inc. (H+A) prepared this report to summarize the findings of remedial investigation (RI) activities conducted at the 40th Street and Indian School Road site (the Site) of the East Central Phoenix (ECP) Water Quality Assurance Revolving Fund (WQARF) area located in Phoenix, Arizona (Figure 1). This RI report was prepared on behalf of the Arizona Department of Environmental Quality (ADEQ) under the H+A ADEQ Contract No: EV09-0100AE for ECP in accordance with Arizona Revised Statutes (A.R.S.) §49-287.03 and Arizona Administrative Code (A.A.C.) R18-16-406.

The purpose of this RI is to characterize and document the nature and extent of compounds of concern in the subsurface and provide the basis for a potential future Feasibility Study (FS) that will evaluate appropriate cleanup actions at the Site, if necessary. Specifically, the objectives of the RI are to collect, analyze, report, and recommend additional data necessary to complete assessment of the following factors:

- Physical characteristics of the Site;
- Identification of present and reasonably foreseeable future uses of land and water at the Site;
- Nature, extent, and sources of contamination at the Site;
- Potential fate and transport of contamination at the Site;
- Potential and actual risk of contaminants to public health, welfare, and the environment; and
- Identification of appropriate remediation goals.

FINAL

1

1.1 SITE BACKGROUND

The Site is located in the 4000 block of East Indian School Road in a mixed residential and commercial area of Phoenix, Arizona (Figure 1). The Site is one of six ECP WQARF sites. The current site is bounded by Devonshire Avenue to the North, 40th Street to the East, East Picadilly Road to the South and 38th Place to the West (ADEQ 2013).

The 40th Street and Indian School Road Site was placed on WQARF Registry List in 1998. The vicinity of the Kachina Cleaners facility and the former Allen's Cleaners facility have been investigated with regard to potential PCE contamination and identified as sources.

- Kachina Cleaners The Kachina Cleaners facility is located approximately 300 feet west of the intersection of North 40th Street and Indian School Road at 3926 East Indian School Road (Figure 2). Kachina Cleaners is a dry cleaning and laundry facility that has been in operation from 1959 to the present (HydroGeoLogic [HGL], 2014). According to information provided to ADEQ, the dry cleaning process involves mixing dry cleaning solvent and detergent together in a dry cleaning machine (SECOR, 2008). Approximately 40 to 50 gallons of PCE was used per week in the dry cleaning process (SECOR, 2008). Spent filters (were/are) removed and disposed by Safety-Kleen Corporation. Waste PCE fluids are distilled for recycling, and leftover amounts of PCE are handled and disposed by Rinchem Company, Inc. (Earth Tech, 1996).
- Former Allen's Cleaners Allen's Cleaners was located approximately 350 feet north of the intersection of North 40th Street and Indian School Road at 4129 North 40th Street. The facility was operated as a dry cleaning facility from approximately 1969 until 1989. The building has since been remodeled as an office building (Figure 2). The predominant dry cleaning solvent used was PCE. Waste disposal was not documented until 1987 when Safety-Kleen Corporation was retained to transport and dispose of generated dry cleaning process waste products (SECOR, 2008).

Several phases of investigation have been conducted including soil and soil vapor sample collection and chemical analyses and groundwater monitoring well installation and sampling. The results of these investigations have indicated that volatile organic compounds (VOCs), primarily PCE, are present in soil, soil vapor, and groundwater in the vicinity of the Site.

FINAL

The research conducted by HGL for provided a summary of the WQARF site, including facilities located within the site boundary and information about their operations, chemical use, waste stream, releases, and regulatory involvement (Appendix A). Results of this research are provided below.

1.1.1 OPERATIONAL HISTORY

1.1.1.1 Kachina Cleaners

The Kachina Cleaners property, located at 3926 East Indian School Road, was purchased by the Tsantilas family in 1955 as vacant land [FSDEQP 2782].¹ On November 13, 1956, a permit for the site was issued to Alden Tyson for the installation of one dry cleaning unit that used nonflammable solvent [FSFDPX 78]. The nature of Mr. Tyson's connection to Kachina Cleaners has not been determined. Despite a permit for dry cleaning being issued for the 3926 East Indian School Road site in 1956, Kachina Cleaners did not begin dry cleaning operations at the site until 1959, when the main building was constructed [FSDEQP 2782].

Kachina Cleaners was incorporated in Arizona on April 19, 1961, as a public laundry and dry cleaning service as well as a coin-operated laundromat. The business was started in 1959 by James Tsantilas. In 1961, control of the business was ceded to Constantine Tsantilas (chief executive officer and president), Bessie Tsantilas (vice president), and Stella Tsantilas (secretary/treasurer) [FSDEQP 2389-2390].

Dry cleaning equipment was located at the north end of the main building beginning in 1959. In 1964, a second, smaller building was constructed north of the main building to house steam boilers and offices [FSDEQP 2782]. According to a 1992 Dun & Bradstreet report, Kachina Cleaners employed 14 people and occupied 3,200 square feet in a one-story concrete block building owned by the corporate officers [FSDEQP 2389-2390].

According to a June 1996 site characterization report prepared by Earth Techchnology Company (Earth Tech), Kachina Cleaners reportedly used 40 to 50 gallons of PCE per week.²

¹ The source document, a 1996 site characterization report prepared by Earth Tech, Inc., states that the Tsantilas family purchased the Kachina Cleaners property in 1953; however a warranty deed for the property was not signed until 1955 by James and Bessie Tsantilas [FSDEQP 2782; FSNETR 35-36]. HGL will use the deed document date as the date of ownership.

² The exact time period for which this volume of PCE use applies is unclear.

Wastewater passed through filters prior to being discharged to the sewer system, which Kachina Cleaners was reportedly connected to in the early 1960s. The spent filters were removed and disposed of by Safety-Kleen Corporation (Safety-Kleen). Waste PCE fluids were distilled for recycling, and leftover amounts of PCE were handled and disposed of by Rinchem Company, Inc. [FSDEQP 2782].

Before being connected to the sewer system, Kachina Cleaners used two cesspools and a septic tank for wastewater disposal. According to the 1996 site characterization report, the cesspools and septic tank were reportedly no longer in use, but were still present. They were located northwest of the main building. In addition, a lint trap was located just south of the septic tank [FSDEQP 2782].

On February 25, 1975, Kachina Cleaners was issued permit 11921 for the operation of a Class III dry cleaning plant. The permit was signed by Stella Tsantilas [FSFDPX 77].

A January 18, 1985, occupancy activity report from the City of Phoenix Fire Department notes the following 13 fire code violations [FSFDPX 37, 39-40]:

- Failure to complete hazardous materials application form;
- Failure to obtain a revised permit to operate a Class III dry cleaning plant;
- Failure to obtain a permit for the use and storage of hazardous chemicals;
- Failure to obtain a permit for the use and storage of flammable liquids;
- Failure to remove accumulated waste/empty containers from the storage room, properly label containers, and store paint and chemicals on stable shelving;
- Failure to remove stacked combustibles and dust from area surrounding dry cleaning equipment;
- Failure to remove all PCE drums from the interior of the building, as no open containers are allowed inside the building;
- Failure to cover the reclaiming tank behind the dryers with a completely sealed lid;
- Failure to repair a broken electrical outlet behind a vending machine;
- Failure to post National Fire Protection Association fire diamonds on the front of the dry cleaning building and on the fenced storage area containing PCE;

- Failure to label all containers with a product's chemical name;
- Failure to store oxidizers in closed containers and to separate them from other material; and
- Failure to safely store flammables.

On March 2, 1985, permit 38461 was issued by the City of Phoenix Fire Department for the storage and handling of flammable/combustible liquids and for the storage and handling of hazardous chemicals/materials [FSFDPX 36].

Kachina Cleaners filed its first U.S. Environmental Protection Agency (EPA) notification of hazardous waste activity form on April 24, 1986. The facility was listed as a small quantity generator (less than 1,000 kilograms [kg] per month) of hazardous waste (EPA hazardous waste codes F001 and F002) [FSDEQP 2376-2377].³

On August 26, 1991, Kachina Cleaners submitted an application for a Maricopa County air quality permit to install one dry-to-dry Multimatic mercury dry cleaning machine with a capacity of 15 pounds (lbs). A 30-ton cooling tower, built-in refrigerated coiling coils, and spin filter were part of the dry cleaning machine. In addition, one gas-fueled Western boiler was listed on the permit application [FSMCAQ 154-169].

A September 21, 1998, Maricopa County application for a non-Title V air quality permit indicates that Kachina Cleaners had two pieces of fuel-burning equipment: one Raynak hot water heater installed in 1974, and one horizontal return tubular boiler installed in November 1991. As for dry cleaning equipment, Kachina Cleaners had one Multimatic Shop Star 500 dry-to-dry cleaning machine installed in October 1996. According to the 1998 application, approximately 300 to 400 gallons of PCE per year were being used in the Multimatic Shop Star 500 dry cleaning machine, which has a capacity of 65 lbs. The equipment also had a cooling tower with 10 tons of cooling capacity and built-in refrigerated condensing coils. A handwritten note calculated the emissions of various constituents, including PCE, which was 8,100 lbs per year, or approximately 22.2 lbs per day [FSMCAQ 118, 120, 122, 124].

³ EPA hazardous waste code F001 represents spent halogenated solvents used in degreasing, including PCE and TCE, among other constituents. EPA hazardous waste code F002 represents spent halogenated solvents, including PCE and 1,1,1-trichloroethane, among other constituents [GDEPAW 2].

Maricopa County air quality permit 980665 was issued to Kachina Cleaners on March 9, 1999, with a renewal date of March 31, 2004 [FSMCAQ 135]. Permit conditions indicated that PCE emission limits were 23 lbs per day, or 8,100 lbs per year. Additionally, Kachina Cleaners was limited to consuming 50 gallons of PCE per month, and no more than 600 gallons per year [FSMCAQ 174].

Kachina Cleaners submitted applications to the Maricopa County Air Quality Department to operate and/or construct a dry cleaning operation on July 2, 2003, and January 20, 2006. Both applications list one piece of equipment, a 65-lb capacity Multimatic Shop Star 500 dry cleaning machine installed in October 1996.⁴ The dry cleaning machine was located on the west side of the main building. According to the applications, Kachina Cleaners was a high volume PCE dry cleaner, using more than 140 gallons of PCE per year, but less than 2,100 gallons per year. Because the equipment was installed after December 9, 1991, gas vapor generated by the equipment was routed through a refrigerated condenser. The July 2, 2003, application lists one Lattner boiler installed in 1991 and one Raytherm boiler installed in 1970. Both boilers were located in the boiler room/office building on the north side of the property. The January 20, 2006, application lists one Lattner "30HP" boiler installed in March 2004 and one Raytherm boiler installed in approximately 1968. The July 2, 2003, application notes that the coin operated laundry was located in the southwest corner of the main building, next to the restrooms. A store room was located in the northwest corner of the main building, and the production area was located along the eastern half of the main building [FSMCAQ 92-116].

Kachina Cleaners submitted a letter on June 19, 2006, to the Maricopa County Air Quality Department to request that a Union L860 Perc Dry Cleaning machine be added to its air quality permit [FSMCAQ 126]. The permit was revised on January 11, 2011, with a new renewal date of January 16, 2016. The equipment listed under this permit included one 65-lbs-per-hour Union L860 PCE dry-to-dry cleaning machine, one 65-lbs-per-hour Multimatic Shop Star 500 dry-to-dry cleaning machine, one 1,255,000-British thermal unit (BTU)-per-hour Lattner boiler, and one 749,800-BTU-per-hour Raytherm boiler [FSMCAQ 222, 228].

Hazardous waste manifests from December 5, 2007, to December 4, 2009, indicate that approximately 5,046 lbs of waste PCE (EPA waste codes D039 and F002) were collected by Univar USA, Englund Equipment Co., SLT Express, Univar USA, Inc., and American Trucking, Inc., and taken to either a

⁴ The January 20, 2006, application states that the Multimatic Shop Star 500 was installed in November 1996 [FSMCAQ 94].

HARGIS + ASSOCIATES, INC.

Systech Environmental Corporation facility in Fredonia, Kansas, or a U.S. Ecology facility in Beatty, Nevada [FSDEQP 2351-2375].⁵

A June 30, 2011, City of Phoenix Fire Department inspection report notes that chemicals were only located in tanks at the dry cleaning machines and that spot removers were located in a metal cabinet. The inspection report states that normal chemicals for dry cleaning were used and that no violations had been found [FSFDPX 35]. As of 2014, Kachina Cleaners is still operating at 3926 East Indian School Road [FSINET 1].

1.1.1.2 Allen's Cleaners

Allen's Cleaners operated a dry cleaning facility at 4129 North 40th Street from 1969 to 1989. Allen's Cleaners used PCE as a dry cleaning solvent during its operations; however, waste disposal at the facility was not documented until 1987, when Safety-Kleen was retained to transport and dispose of dry cleaning waste products [FSDEQP 2678, 2717].

A December 29, 1993, site assessment and analytical data summary letter from Gulf-Pacific Environmental Engineering, Inc. (Gulf-Pacific) to ADEQ indicates that no aboveground storage tanks were found to exist on the former Allen's Cleaners property. However, an underground vault was located in the northeast corner of the laundry just inside the rear doors. The plumbing in the area of the vault consisted of a 4-inch cast iron sewer service line that passed near the west side of the vault at a depth of 5.5 feet. However, there was no fluid connection between the vault and the sewer. The vault collected drainage from a floor drain connected to a vent pipe located on the east wall of the facility. A second vent line originating in the laundry area ran along the north wall and connected with the vault. This line had no physical connection to the sewer, and the access drains to this line were capped. The vault and plumbing were removed, broken down, and placed in drums by Gulf-Pacific in November 1993 [FSDEQP 2546-2547].

According to the December 29, 1993, letter, the analytical results of the excavated materials suggested the following:

The only evidence of a potential release is from the vault itself. This evidence suggests very low quantities were released and does not support the wide area contamination reported in previous studies. A small amount of staining was observed in the matrix of

⁵ EPA hazardous waste codes D039 represents a waste that contains PCE. EPA hazardous waste code F002 represents spent halogenated solvents, including PCE and TCE, among other constituents [GDEPAW 1-2].

the vault and low levels of contamination was [*sic*] documented through the analytical results of samples collected [FSDEQP 2547].

Allen's Cleaners operated at the site until 1989. Some additional information regarding operations at Allen's Cleaners is available, but considered privileged at this time and, as a result, is not included in this letter report.

1.1.2 REGULATORY INVOLVEMENT HISTORY

1.1.2.1 Kachina Cleaners

An October 1988 draft Phase I report prepared by Earth Tech identified Kachina Cleaners as a high potential source of chemical contamination detected in Salt River Project (SRP) Well 17.9E-7.5N because it was located approximately 0.5 mile north of the well and had documented use of PCE.⁶ According to the 1988 Phase I report, the concentration of PCE detected in SRP Well 17.9E-7.5N was 66.0 µg/L, which exceeded the Arizona action level of 1.0 µg/L, making the well a high priority for remedial efforts. The report also identified Kachina Cleaners as a medium potential source of contamination in another well, SRP Well 17E-8N, located approximately 1 mile east of Kachina Cleaners. PCE had been detected in this well at a concentration of 8.7 µg/L. The report notes that during field reconnaissance Earth Tech personnel observed two 55-gallon drums of PCE stored in an enclosed, secured area behind the facility. These drums appeared to be in good condition, with closed lids and clear labels. According to the 1988 Phase I report, 180 to 240 pounds of PCE per month were being transported from this facility to Safety-Kleen for disposal. In addition, the 1988 draft Phase I report notes that there were no records of any Resource Conservation and Recovery Act (RCRA) compliance actions pertaining to Kachina Cleaners [FSDEQP 2396, 2406, 2450-2451, 2527].

In October 1989, a soil gas survey was conducted by Earth Tech in the ECP WQARF study area, and a sample was taken at Kachina Cleaners because of its known PCE use. The soil gas sample was taken at a depth of 16.5 feet bgs on the north side of the facility and PCE was detected at 270 µg/L [FSDEQP 2680; TIDEQP 1305-1306, 1312].

⁶ The source document initially identifies this well as SRP Well 17.4E-7.5N, but then subsequently refers to it as SRP Well 17.9E-7.5N [FSDEQP 2449-2450]. HGL has confirmed that SRP Well 17.9E-7.5N is the well located within the 40th Street and Osborn Road WQARF site [FODEQP 294-303].

In May 1994, Earth Tech conducted groundwater sampling at seven dry cleaning facilities based on results of the 1989 soil gas sampling.⁷ The monitoring well at Kachina Cleaners (KMW-01) was located 40 feet downgradient of the facility on an adjacent property and drilled to a depth of 60 feet bgs. One sample and a duplicate were collected. PCE was detected at 55 μ g/L and 58 μ g/L, respectively, while TCE was detected at 1.4 μ g/L in both samples. The PCE concentrations exceeded the EPA maximum contaminant level (MCL) and AWQS limit of 5.0 μ g/L, while the TCE concentrations were below the EPA MCL and AWQS limit of 5.0 μ g/L. [FSDEQP 2888-2899].

In December 1994, groundwater samples were taken at KMW-01. PCE was detected at 130 µg/L and TCE was detected at 2.3 µg/L [FSDEQP 2919, 2924-2925]. On March 29, 1996, an access agreement was executed between ADEQ and Kachina Cleaners. The agreement allowed ADEQ access to the Kachina Cleaners property for investigation activities and remedial actions regarding soil and groundwater contamination potentially located at or near the facility [FSDEQP 2880-2884].

During a May 1996 site investigation, Earth Tech advanced eight soil borings to approximately 17 feet bgs in the parking lot north and west of the Kachina Cleaners main building and one inside the building. See Figure 2 (Enclosure 3). Soil vapor samples were collected at 5, 10, and 15 feet bgs. PCE was detected in soil vapor at all depths. In the parking lot borings, PCE was detected at levels ranging from 4.2 µg/L to 460 µg/L, with the highest concentrations detected at all depths in the borings located immediately to the west and north of the building. Ten soil samples and one duplicate sample were also collected as part of the site investigation. The samples were collected at 7, 12, or 17 feet bgs. Four soil samples (three collected at 7 feet bgs and one collected at 17 feet bgs) were found to have PCE detections at levels above the laboratory reporting limit of 1 microgram per kilogram (µg/kg) (0.001 milligram per kilogram [mg/kg]). These four soil samples coincided with the samples containing the highest soil vapor results for PCE as well as with the sample taken inside the Kachina Cleaners building.

PCE in soil ranged from 3.3 to 5.6 μ g/kg (0.0033 to 0.0056 mg/kg) in the three samples collected at 7 feet bgs. The fourth soil sample was collected at 17 feet bgs and was found to contain 1.8 μ g/kg (0.0018 mg/kg) of PCE. Despite having PCE detections in soil, all PCE sample results were below the

⁷ Of the seven facilities, only Kachina Cleaners and Allen's Cleaners are located within the ECP 40th Street and Indian School WQARF site addressed by this report.

non-residential soil remediation level (SRL) of 13 mg/kg and the groundwater protection level (GPL) of 0.80 mg/kg [FSDEQP 2781, 2785-2790; GDDEQW 27, 40].

The May 1996 site characterization investigation suggested that the source of contamination may have been removed. According to the investigation, the origin of the PCE contamination had been the dry cleaning equipment located inside the west wall of the building, the facility sewer line, and the former septic systems at the northwest corner of the building. In addition, the lint trap located near the northwest corner of the building may have been a source of the PCE contamination, according to the site characterization investigation. PCE and TCE contamination had been detected in one monitoring well, KMW-01, located west of the facility. However, there was no well upgradient from Kachina Cleaners that could be used to confirm that the PCE and TCE detected in groundwater had originated from the facility [FSDEQP 2793, 2795-2796].

During a May 1997 hydropunch investigation, soil boring HP-AC3 was installed approximately 270 feet west of monitoring well KMW-01. Soil samples collected from 45 and 60 feet bgs did not contain PCE at concentrations at or above the method detection limit (MDL) of 0.05 mg/kg. In-situ groundwater samples were collected at approximately 30, 75, 90 and 105 feet bgs. Dissolved-phase PCE was detected in the samples collected from 30 feet bgs (800 μ g/L) and 75 feet bgs (2.42 μ g/L) [FSDEQP 2680-2681].

Inspections of the two dry cleaning machines were conducted by the Maricopa County Air Quality Department between March 2000 and February 2009. Average use of PCE was reported as being between 25 and 40 gallons per month. No violations were reported during any of the inspections, and the facility was in compliance with all regulations. However, a January 31, 2002, inspection included a "notice to correct" statement asking Kachina Cleaners to conduct weekly maintenance checks instead of biweekly checks [FSMCAQ 136-146, 210-213]. In May 2006, groundwater monitoring well KMW-02 and three additional soil borings (KSB1 through KSB3) were installed near the Kachina Cleaners facility to further assess the vertical and lateral extent of PCE and TCE in soil, soil gas, and groundwater. Laboratory analysis detected PCE in soil above the method reporting limit (MRL) in only one sample.

The sample from boring KSB3 taken at 10 feet bgs contained 0.12 mg/kg of PCE, which was below the non-residential SRL of 13 mg/kg and the GPL of 0.80 mg/kg. Concentrations of PCE were reported in in situ groundwater samples collected at 52 to 54 feet bgs from all four drilling locations. These PCE

HARGIS + ASSOCIATES, INC.

concentrations ranged from 1.2 μ g/L (in the KMW-02 sample) to 400 μ g/L (in the KSB3 sample). Soil vapor samples were collected from all four borings, and concentrations of PCE were detected in all samples [FSDEQP 2681; GDDEQW 27, 40].⁸

On March 7, 2006, an environmental access agreement was executed between ADEQ and Constantine and Stella Tsantilas, as trustees of the Constantine Tsantilas and Stella Tsantilas Revocable Trust (owners of Kachina Cleaners). The agreement granted an easement to ADEQ for conducting remedial, response, and corrective actions at the Kachina Cleaners facility. The agreement is described as a covenant running with the property, binding any successive property owners or tenants and terminating upon ADEQ's discretion [FSDEQP 2538-2545].

An order of abatement by consent regarding permit G03447 was executed on August 8, 2007, between Kachina Cleaners and the Maricopa County Air Quality Department. The order states that on June 20, 2007, the Maricopa County Air Quality Department (MCAQD) issued Kachina Cleaners a notice of violation for failure to submit an annual emissions inventory report for 2006. In consideration for not pursing criminal or civil actions against Kachina Cleaners, the company agreed to pay a one-time fee of \$660 to the MCAQD and comply with all Maricopa County Air Pollution Control regulations. Payment of the fee, which occurred on August 8, 2007, constituted appropriate resolution of the violations [FSMCAQ 147-153].

An August 2007 fluid level monitoring report, prepared by SECOR International Inc., provides a summary of groundwater sampling results from 1994 to 2007 for VOCs detected in monitoring wells KMW-01 and KMW-02 near the Kachina Cleaners facility. Table 1 below highlights the PCE and TCE results above AWQS limits. Note that no results exceeding AWQS limits were recorded from well KMW-02 [FSDEQP 2667].

⁸ The source document does not provide further details regarding the concentrations of PCE in the soil vapor samples.

Table 1 from (HGL, 2014) PCE and TCE Groundwater Concentrations Exceeding AWQS Limits at Kachina Cleaners, May 1994 to March 2007*

Monitoring Well	Year	Sample Depth (Feet)	PCE (µg/L)	TCE (μg/L)

* = Sampling was not reported for 1995 or for 1999 to 2001.

NA = Not available.

- = Results not detected above AWQS limits.

Ranges of data indicate more than one sampling event occurred in the year.

1.1.2.2 Allen's Cleaners

In October 1989, a soil gas survey was conducted by Earth Tech in the ECP WQARF study area, and a sample was taken at Allen's Cleaners because of its PCE use. The soil gas sample was taken at a depth of 15.2 feet bgs. PCE was detected at a concentration of 370 μ g/L [TIDEQP 1305-1306, 1312].

In April 1992, Earth Tech drilled five soil borings (AB-1 through AB-5) north of the former Allen's Cleaners and one soil boring (AB-6) to the west and downgradient of the facility. Borings AB-1 and AB-2 were drilled by hollow stem auger to a depth of 26 feet bgs. Borings AB-3 and AB-4 were drilled by hand auger to a depth of 13 feet bgs. Boring AB-5 was drilled by hand auger to a depth of 8.5 feet bgs. Boring AB-6 was drilled to a depth of 61 feet bgs and later completed as groundwater monitoring well AMW-01 with a screen interval of 20 to 60 feet bgs. See Figure 3 (Enclosure 4) for sampling

locations. Soil samples were collected at depths ranging from 5 to 15 feet bgs in AB-1 and AB-2; 4.5 to 8.5 feet in AB-3 through AB-5; and 10 to 30 feet bgs in AB-6. Laboratory analysis of the soil samples identified the presence of PCE in two samples: AB-2 collected at 5 feet bgs with a concentration of 52 μ g/kg (0.052 mg/kg); and AB-6 collected at 30 feet bgs with a concentration of 188 μ g/kg (0.188 mg/kg).

Both of these sample detections were below the non-residential SRL for PCE of 13 mg/kg and the GPL for PCE of 0.80 mg/kg. A groundwater sample was collected from AMW-01 on April 21, 1992. Laboratory analytical results identified dissolved-phase PCE and TCE at concentrations of 8,700 μ g/L and 80 μ g/L, respectively, well above the AWQS limit of 5 μ g/L for both PCE and TCE. A May 22, 1992, groundwater sampling event found PCE in AMW-01 at 12,000 μ g/L, with 10,000 μ g/L in a duplicate sample. TCE was not detected above the laboratory detection limit in the May sampling events, but that limit was set at 100 μ g/L [FSDEQP 2682; GDDEQW 27, 40; TIDEQP 1825-1836].

In June 1992, Earth Tech installed a second groundwater monitoring well (AMW-02) upgradient from the former Allen's Cleaners and a third groundwater monitoring well (AMW-03) 0.25 mile south of the former Allen's Cleaners, approximately 200 feet west of 40th Street on Clarendon Avenue. Both wells were drilled to a depth of 60 feet bgs and screened at 20 to 60 feet bgs [FSDEQP 2682; TIDEQP 1833-1836].⁹

Sampling of wells AMW-01 through AMW-03 occurred in July and August 1992. Analytical results for PCE and TCE concentrations are summarized in Table 2. See Figure 3 (Enclosure 4) for sampling locations [FSDEQP 2919, 2923].

Monitoring	Date	PCE	TCE
Well	Sampled	(µg/L)	(µg/L)
AWQS Limit		5	5
AMW-01	07/02/1992	15,000	230
	08/11/1992	5,900	120
AMW-02	07/12/1992	0.5	<0.2
	08/10/1992	3.4	<0.2
AMW-03	08/10/1992	<0.2	<0.2

 Table 2 from (HGL, 2014)

 Allen's Cleaners Groundwater Sample Results, July and August 1992

⁹ Note that AMW-03 is not depicted on Figure 3 (Enclosure 4).

In May 1993, ADEQ conducted a hazardous waste inspection of the former Allen's Cleaners facility. During this inspection, ADEQ identified two deep sump structures located along the east wall of the facility. Based on the presence of solvent-like odors emanating from the sumps, ADEQ collected five sludge samples from the sumps and one background soil sample. The background soil sample was collected in the alley approximately 200 feet northeast of the building.

According to ADEQ, four of the six sludge samples contained TCE and "unidentified analytes," and PCE was found in the background sample. The actual concentrations were not provided in the ADEQ hazardous waste inspection report. The sump contents were removed by Chem Waste on June 14, 1993 [FSDEQP 2682-2683].

In the summer and fall of 1993, Gulf-Pacific conducted a series of investigations into the sumps noted above and the sewer line located to the north of the former Allen's Cleaners. Additionally, an SVE system was established in a nested vapor extraction well located near the northernmost sump. Laboratory analysis of a sludge sample collected from the northernmost sump identified the presence of PCE (977.9 mg/kg), TCE (4.20 mg/kg), and 1,1,1-trichloroethane (1,1,1-TCA) (5.70 mg/kg).¹⁰ Following removal of the sump, a soil sample was collected at approximately 6 feet bgs from a boring placed within the excavation. PCE was detected in this sample at a concentration of 2.75 mg/kg. Four borings were advanced along the sewer line to the north of the building. Soil samples were collected at 5.5 and 7 feet bgs. None of the soil samples collected along the sewer line contained PCE above laboratory MRLs. During operation of the SVE system, vapors were extracted from the shallow and intermediate depth wells at a calculated extraction rate of 0.22 pounds of PCE per day. Documents obtained by HGL do not indicate how long the SVE system operated or how much PCE was removed from the soil beneath the former sump structure [FSDEQP 2546, 2548-2549, 2683, 2712, 2724-2725].

A December 1994 groundwater sampling event for monitoring wells AMW-01, AMW-02, and AMW-03 at the former Allen's Cleaners found a range of PCE and TCE concentrations. Table 3 summarizes the sampling results for PCE and TCE. See Figure 3 (Enclosure 4) for sampling locations [FSDEQP 2919, 2923].

¹⁰ The non-residential SRL is 13 mg/kg for PCE, 65 mg/kg for TCE, and 1,200 mg/kg for 1,1,1-TCA [GDDEQW 27-28].

Monitoring Well	PCE (µg/L)	TCE (μg/L)
AWQS Limit	5	5
AMW-01	31,000*	<500
AMW-01D	24,000	490
AMW-02	12	<0.50
AMW-03	<0.5	< 0.50

Table 3 from (HGL, 2014) Allen's Cleaners Groundwater Sample Results, December 16, 1994

D = Duplicate sample.

*The table and figure in the source document identifies the PCE concentration at AMW-01 as 31,000 μ g/L; however, the text identifies the concentration as 34,000 μ g/L [FSDEQP 2919, 2921, 2923].

In January 1997, a subsurface soil investigation was conducted at the former Allen's Cleaners. Soil borings BB-1 and BB-2 were located inside the building near the former sumps, and boring BB-3 was located near the northwest corner of the building. Soil samples were collected at depths ranging from 7 to 25 feet bgs. Laboratory analysis did not detect VOC concentrations at or above the MDL in any of the collected soil samples. Soil gas samples were collected for laboratory analysis at depths of 7 and 20 feet bgs. Laboratory analysis identified the presence of PCE in all of the soil gas borings. The maximum concentration of PCE detected (33 μ g/L) was in the soil gas sample collected at 7 feet bgs in boring BB-3 [FSDEQP 2683-2684].¹¹

In April 1997, three groundwater monitoring wells (AMW-04, AMW-05, AMW-0) were installed along the western portion of the former Allen's Cleaners property. In August 1997 a fourth well (AMW-07) was installed in the same location. AMW-04 was drilled to a depth of 100 feet bgs and screened at 80 to 100 feet bgs. AMW-05 through AMW-07 were drilled to a depth of approximately 60 feet bgs and screened at 30 to 50 feet bgs. During drilling activities, in situ groundwater samples were taken at various depths between 35 and 98 feet bgs. Samples from AMW-04 were collected at 55, 60, 75, 80, 90, and 98 feet bgs. Samples from AMW-05 were collected at 40 and 55 feet bgs. Samples from AMW-06 were collected at 35, 45, 50, and 60 feet bgs. Samples from AMW-07 were collected at 37 feet bgs. Laboratory analysis detected concentrations of dissolved-phase PCE above the AWQS limit of 5 μ g/L in the in situ groundwater samples collected from boring AMW-04 at 55 feet bgs (7.6 μ g/L), 90 feet bgs (13 μ g/L), and 98 feet bgs (7.1 μ g/L); from boring AMW-05 at 40 feet bgs (120 μ g/L); and from boring AMW-06 at 35 feet bgs (8,500 μ g/L) and 45 feet bgs (23 μ g/L) [FSDEQP 2684].¹²

¹¹ Analytical data for all samples and depicted locations of the wells were not provided in the source document.

¹² The location of the wells was not provided in the source document.

Under a separate investigation in May 1997, two soil borings, HP-AC1 and HP-AC2, were drilled downgradient (to the west) of the former Allen's Cleaners. Boring HP-AC1 was drilled to a depth of 124 bgs. Boring HP-AC2 was drilled to a depth of 112 feet bgs. No soil samples were collected for boring HP-AC1, but in-situ groundwater samples were collected at the following depths: 33, 48, 63, 78, 105, and 120 feet bgs. Dissolved-phase PCE was detected above the AWQS limit of 5.0 μ g/L in groundwater samples collected at 33 feet bgs (44.5 μ g/L) and 48 feet bgs (316 μ g/L). Laboratory analysis of groundwater samples collected at depths greater than 48 feet bgs did not contain concentrations of dissolved-phase PCE above the MDL (1.0 μ g/L). For boring HP-AC2, one soil sample was collected at 70 feet bgs and no PCE was detected. In situ groundwater samples were collected from boring HP-AC2 at the following depths: 30, 45, 75, 90, and 105 feet bgs. Dissolved-phase PCE was detected at levels exceeding the AWQS limit of 5.0 μ g/L in the groundwater sample collected at 45 feet bgs (43.2 μ g/L) FSDEQP 2684-2685].¹³

In December 2003, three SVE and six AS wells were installed at the former Allen's Cleaners. An SVE/AS system was installed and started in November 2004. As of July 8, 2005, the SVE/AS system had removed approximately 33 pounds of PCE and was then decommissioned on that date [FSDEQP 2686].

An August 2007 fluid level monitoring report, prepared by SECOR International Inc., provides a summary of groundwater sampling results from 1992 to 2007 for selected VOCs, including PCE and TCE, detected in monitoring wells AMW-01 through AMW-08 near the former Allen's Cleaners facility.¹⁴ Table 4 below highlights the PCE and TCE results above AWQS limits. Note that no results exceeding AWQS limits were recorded from well AMW-03 and AMW-04 [FSDEQP 2662-2666].

¹³ Analytical data for all samples and depicted locations of the wells was not provided in the source document.

¹⁴ AMW-08 appears to have been installed in 2003 as the first sampling event noted is June 13, 2003. The well is located approximately 350 feet southwest of the former Allen's Cleaners property on the west side of 40th Street [FSDEQP 2666, 2670].

1.1.3 OWNERSHIP HISTORY

1.1.3.1 Kachina Cleaners

Kachina Cleaners has operated on Parcel 170-32-099D at 3926 East Indian School Road from 1959 to present. This parcel is currently owned by Constantine and Stella Tsantilas, as trustees of the Constantine and Stella Tsantilas Revocable Trust, and comprises approximately 12,060 square feet [FSMCTA 1-2]. Table 5 below lists the owners of Parcel 170-32-099D during the time PCE was used on the property. The complete conveyances for this parcel are shown in the title tree enclosed as Figure 4 (Enclosure 5).

Owner	Date	
James and Bessie Tsantilas	1955–1973	
Bessie Tsantilas	1973–1988	
Constantine and Stella Tsantilas	1973–1999	
Constantine and Stella Tsantilas Revocable Trust	1999–Present	

Table 5 from (HGL, 2014)List of Owners for Parcel 170-32-099D

Parcel 170-32-099D was purchased by the Tsantilas family in 1955 as vacant land [FSDEQP 2782].¹⁵ PCE use at the property is assumed to have started in 1959 when dry cleaning operations began. Kachina Cleaners is currently operating on the site and is believed to still use PCE, though it is only used in the dry cleaning machines and not stored on site [FSDEQP 2351-2375, 2782; FSFDPX 35].

¹⁵ The source document, a 1996 site characterization report prepared by Earth Tech, states that the Tsantilas family purchased the property in 1953; however, a warranty deed for the property was not signed until 1955 by James and Bessie Tsantilas [FSDEQP 2782; FSNETR 35-36]. HGL will use the deed document date as the date of ownership.

1.1.3.2 Allen's Cleaners

Allen's Cleaners operated on Parcel 171-26-061G at 4129 North 40th Street from 1969 to 1989.¹⁶ The current parcel owner is Verde SPE I, LLC, a Delaware corporation. Table 6 below lists the owners for Parcel 171-26-061G during the time PCE was used on the property. The complete conveyances for this parcel are shown in the title tree enclosed as Figure 5 (Enclosure 6).+

Table 6 from (HGL, 2014) List of Owners for Parcel 171-26-061G

Owner	Date
Herbert and Norma Potthoff	1958–1977
Harris Trust Company and Rose Morgan,	1977–1984
Co-trustees of the Herbert Potthoff Revocable Trust	
Palm Grove Redevelopers	1984–1999

Allen's Cleaners operated on Parcel 171-26-061G from 1969 to 1989. Allen's Cleaners used PCE dry cleaning solvent during its operations; however, the exact period of use is not documented, though it is assumed that the company used PCE throughout its entire period of operations [FSDEQP 2678].

1.2 WQARF PROCESS

The WQARF program was created by the Arizona Legislature under the Environmental Quality Act of 1986 to support environmental cleanup efforts in Arizona. WQARF was amended in 1997 to include additional public notice and community involvement requirements (ADEQ, 2013). Through the WQARF program, ADEQ identifies, assesses, and cleans up soil and groundwater that is contaminated with hazardous substances (ADEQ, 2013). Before a site is placed under the WQARF program, it is evaluated for the type of contaminant(s) present, the location of the contaminant(s), and the number of people that may be affected by the contaminant(s) and assigned a numeric score with a maximum of 120. Sites placed under the WQARF program are listed in the WQARF Registry. As part of the WQARF process the ADEQ may:

- Perform emergency responses.
- Conduct investigations including remedial investigations, feasibility studies, and risk assessment.

¹⁶ 17 Parcel 171-26-061G was created in 2007 when Parcels 171-26-061E and 171-26-061F were merged.

- Conduct long-term remedial action programs.
- Identify potential responsible parties.
- Perform outreach programs to the public including the formation of community advisory boards (CABs). (A.R.S. 49-282)

The ECP study area was placed on the WQARF Priority List in 1987, and the 40th Street and Indian School Road Site was subsequently placed on the WQARF registry in 1998 with a score of 20 out of the possible 120 (ADEQ, 2013; HGL, 2014).

2.0 PREVIOUS INVESTIGATIONS AND EARLY RESPONSE ACTIONS

The original ECP 40th Street and Indian School Road WQARF study area investigation began after the 1989 discovery of PCE in a soil vapor sample taken north of Kachina Cleaners and Laundry, Inc. (Kachina Cleaners) at 16.5 feet below ground surface (bgs). The concentration of PCE in the soil vapor sample was 270 micrograms per liter (μ g/L). Another soil vapor sample was taken north of the former Allen's Cleaners and Laundry, Inc. (Allen's Cleaners) at 15.2 feet bgs. PCE was detected in that sample at a concentration of 370 μ g/L (HGL, 2014).

In 1997, groundwater, soil, and soil vapor surveys were conducted at the former Allen's Cleaners. PCE in groundwater was detected at concentrations up to 316 μ g/L. Soil samples did not contain detectable concentrations of PCE. Soil vapor concentrations of PCE ranged from 0.13 μ g/L to 33 μ g/L. Also in 1997, ADEQ installed four groundwater monitoring wells west of the former Allen's Cleaners. Initial groundwater samples collected from these wells reported a maximum PCE concentration of 1,800 μ g/L. ADEQ also collected groundwater and soil samples in the vicinity of Kachina Cleaners in 1997. PCE in groundwater was detected with concentrations up to 800 μ g/L. The soil samples did not contain detectable concentrations of PCE (HGL, 2014).

A 2002 ADEQ groundwater sampling event showed the continued presence of PCE above the 5 µg/L AWQS limit. In 2003, ADEQ installed a groundwater monitoring well in the alley between the former Allen's Cleaners and Kachina Cleaners. ADEQ also installed three SVE wells and six AS wells at the former Allen's Cleaners as part of an early response action (ERA). In 2005, the SVE/AS system was decommissioned and removed from the former Allen's Cleaners. The SVE/AS system had removed approximately 33 pounds of PCE from the vadose zone throughout its operation (Figure 6) (HGL, 2014).

In 2007, ADEQ sent out notices per Arizona Revised Statutes (A.R.S) § 49-287.03, initiating the Remedial Investigation (RI) for the site, and installed an additional groundwater monitoring well on 39th Street, north of Indian School Road. In 2008, ADEQ installed two more groundwater wells: one on 39th Street, north of Indian School Road, and one on Monterosa Street, south of the former Allen's Cleaners. Concentrations of PCE were still detected above the AWQS limit of 5 µg/L.

From 2009 to 2012, ADEQ did not conduct work at the site. In October 2013, ADEQ began additional well installation and groundwater sampling activities, to be presented in this report.

Refer to Tables 1 to 5 and Appendices A and B for a summary of data collected during previous investigations.

3.0 SITE PHYSICAL CHARACTERISTICS

3.1 DEMOGRAPHICS AND LAND USE

The entire Site is located within the City of Phoenix (COP), in Maricopa County. The COP is comprised of 15 "urban villages"; the ECP Site is located in the center of the Camelback East Village (CEV) which covers an area of 36.3 square miles. CEV has two primary cores: 1) the 24th Street and Camelback Road core; comprised of office and retail shops, including movie theaters, major department stores, restaurants, and hotels; and 2) the 44th Street and Van Buren Street core an area of airport and regional offices along with a Chinese cultural center. The area around 44th Street and Thomas Road is considered a secondary core of the village. CEV offers a range of housing diversity and neighborhood types evenly split in the number of single family and multi-family residences, ranging from multi-acre lots to higher density residential developments in the more concentrated centers. A major portion of the housing stock in CEV was built between 1950 and 1970, but new construction of both single family and multi-family homes continues.

Detailed information regarding current and future uses of land or water impacted by a contaminant release from the Site is provided in the Land and Water Use Report (LWUR) presented in Appendix F. According to COP, the primary land use within the CEV is single family residential (38%) followed by parks/open space (26%), multiple family residential (12%) and commercial/industrial (12%), public/transportation (8%). Four (4%) percent of the land within the village is reportedly vacant. Current zoning districts in the Site as well as a detailed description of COP zoning designations can be found in the LWUR in Appendix F.

The ECP study area is an older established part of Phoenix that is mostly residential and commercial with dry cleaning businesses and strip malls containing retail stores (ADEQ, 2013). General land use within 0.25 mile of the 40th Street and Indian School Road Site is presented in Figure 3. The majority of commercial zoning is along the Indian School road commercial corridor.

Presently, the area within the Site boundary is zoned for commercial and single family residential use. Surrounding land uses include single family residential to the south and north, and commercial to the east and west, and multi-family residential to the south and northwest.

Five school districts are represented in the entire CEV, three are located within the ECP WQARF Site: 1) Scottsdale Unified School District, 2) Phoenix Union School District, and 3) Creighton School District. Monte Vista School (Creighton School District) and Christ Lutheran School are located in the vicinity of the 38th Street and Indian School Road Site. Christ Lutheran School is located approximately 400 feet to the west of the intersection of 40th Street and Indian School Road and Monte Vista School is located approximately one mile southwest of the Site (City of Phoenix, 2014).

The zoning pattern in the area has been long established and there are no foreseeable changes for the future. Land uses for the Site are expected to remain predominantly residential and commercial.

3.2 CLIMATE

The Phoenix area climate is of a desert type with low annual rainfall and low relative humidity (Schmidli, 1996). The hottest month of the year is July where the average minimum and maximum temperatures range from 84 degrees Fahrenheit (°F) to 106°F. The coolest month of the year is December where the average minimum and maximum temperatures range from 44°F to 66°F (Western Regional Climate Center [WRCC], 2014b).

Annual precipitation averages for Phoenix range between 6.6 to 7.5 inches (WRCC, 2014a and 2014b). There are two separate rainfall seasons. The first rainfall season occurs from December through April from occasional Pacific storm systems. The second rainfall period (also known as the Arizona Monsoon) occurs from July through September when southerly winds bring moisture from the Pacific Ocean, Gulf of Mexico, and the Gulf of California (Schmidli, 1996; The Flood Control District of Maricopa County, 2014).

3.3 TOPOGRAPHY

The Site is located in a relatively flat alluvial valley at an elevation of approximately 1,200 feet mean sea level (msl). The land surface slopes gently to the southwest at a gradient of 0.005 away from the Camelback Mountains. The Camelback Mountains, located approximately 1.6 miles to the northeast, rise 1,250 feet above the valley surface to an elevation of 2,600 feet msl. Also approximately 2.2 miles to the southeast are the low lying Barnes and Papago Buttes which rise 350 feet above the valley surface up to an elevation of 1,570 feet msl.

24

3.4 SURFACE WATER

The nearest surface water body is the Arizona Canal, located approximately 0.75 miles to the northeast of the Site. The Site area is situated within an active flood irrigation district of Salt River Project (SRP), which receives water from the Arizona Canal lateral canals. The water is used for residential irrigation; it discharges into the Grand Canal located over two (2) miles southwest of the Site.

3.5 REGIONAL GEOLOGY

The Site is located on the western portion of the Salt River Valley (WSRV), a broad, relatively level alluvial valley in the Basin and Range physiographic province of Central Arizona. This alluvium represents a combination of deposits from the surrounding mountains and fluvial deposits from the Salt River.

The stratigraphy of the WSRV is divided into the Mountain Bedrock, Pre-Basin and Range Sediments, Lower Basin-Fill, Upper Basin-Fill, and Stream Alluvium (Anderson et al., 1990). In upward sequence, the Mountain Bedrock consists of igneous, metamorphic, and consolidated sedimentary rocks ranging from Precambrian to Cenozoic in age. The Pre-Basin and Range Sediments consist of moderately to highly consolidated continental deposits of silt, clay, gravel, and conglomerate, primarily Tertiary in age. Examples of these sediments would be the Camelshead Formation and the Tempe Beds, exposed in Papago Park area of east Phoenix. These sediments generally exceed several thousand feet in thickness.

Above the Pre-Basin and Range Sediments lie the Lower Basin-Fill Sediments. The thickness, areal extent, and grain size of the Lower Basin-Fill Sediments are variable, but generally consist of weakly to highly consolidated gravel, sand, silt, and clay and may include interbedded evaporate deposits and volcanic rocks at selected locations. The Lower Basin-Fill Sediments typically include 2,000 to 7,000 feet of fine-grained sediments of silt and clay at the base, in the center of the basins in which these deposits are found.

The Upper Basin fill is generally composed of unconsolidated to moderately consolidated fanglomerates and alluvial deposits laid down during the last stages of the Basin and Range disturbance. This unit also grades into finer-grained facies towards the interiors of the basins, but is generally coarser than the lower unit and with less evaporites. This unit generally produces substantial amounts of groundwater compared to the lower units.

25

Some fine-grained deposits in this unit impede the vertical migration of groundwater, such that perched or semi-perched conditions exist. The Upper Basin fill is composed mainly of silt, sand, and gravel; locally, relatively thin clay layers can be present. Within the WSRV, the unit is predominantly gravel and sand with some thick zones of cobbles near the present channels of the Salt River. Gravel and sand is also found in areas north and south of the present-day channel, where ancestral channels were located.

The upper-most geologic unit in the WSRV is the Stream Alluvium, which represents stream channel and related sediments typically up to 1,200 feet thick. This sedimentary unit was deposited after the basins were filled, and during the establishment of the present drainage system. Stream Alluvium sediments consist of floodplain, channel-fill, alluvial-fan, and playa deposits. The Stream Alluvium is generally unconsolidated, except where cemented by caliche. Grain size ranges from boulder-and cobble-size gravel in the alluvial fans to clays in local playa deposits. In general, sand and gravel are found along the stream channels (Anderson et al., 1990).

3.6 REGIONAL HYDROGEOLOGY

The Arizona Department of Water Resources (ADWR) documented the Site area hydrogeology in a document titled *A Regional Groundwater Flow Model of the Salt River Valley-Phase I Phoenix Active Management Area Hydrogeologic Framework and Basic Data Report* (ADWR, 1993). Although the hydrogeologic stratigraphy generally corresponds to the geologic units, the correlation is not exact and different unit names are used.

The alluvial sediments (Lower and Upper Basin Fill) are subdivided into three hydrologic units: the Upper, Middle, and Lower Alluvial Units (UAU, MAU, and LAU, respectively) (Figure 4). The total thickness of alluvial sediments is estimated to be less than 250 feet thick in the vicinity of the Site, which lies near the edge of the alluvial basin (ADWR, 2009).

The LAU is composed of consolidated sands and gravels. The MAU is also consolidated, but it contains a higher proportion of fine-grained material. Both the MAU and LAU represent a depositional environment within closed basin (lake bed) conditions. Although the hydraulic properties of the MAU are less favorable for water production, the MAU is the most productive unit basin-wide due to its

HARGIS + ASSOCIATES, INC.

saturated thickness. It has been reported that the MAU is absent in the ECP area such that the UAU and LAU appear to have a hydraulic connection (Earth Tech, 1992 and 1995a).

The UAU consists of unconsolidated sands and gravels deposited by flowing drainages, and is the most permeable unit. According to the ADWR, the UAU is typically 300 to 400 feet thick in the WSRV. Where thick saturated sections of the UAU are present, the groundwater production rates are generally very high.

In addition to the UAU, MAU and LAU, several noted geologic units have been classified, including the Pre-Basin and Range sedimentary units (Tempe Beds and Camelshead Formation) and the crystalline bedrock. Hydrologically, these units are not significant for groundwater use or production except in a few limited areas of the WSRV.

3.7 LOCAL GEOLOGY AND HYDROGEOLOGY

The hydrostratigraphic units have been defined based on a review and evaluation of data generated during groundwater assessments at the Site. The Site hydrogeology has been investigated to a maximum depth of 145 feet bgs (Figure 5). Available Site boring logs are included in Appendix C. Groundwater monitor wells have been installed at 25 locations to a maximum depth of approximately 145 feet bgs within the UAU (Table 1). The base of the UAU has not been encountered during drilling activities to date; however, it has been reported that the UAU ranges in thickness from approximately 125 to 300 feet in the ECP area (Earth Tech, 1995). The UAU at the Site consists of predominantly fine-grained, clayey silts and silt with sand to sandy silts with trace amounts of gravel.

The horizontal hydraulic conductivity of the clayey sand with gravel/sandy gravel with silt range from 0.75 to 130 feet per day based on slug tests conducted at monitor wells AMW-01 and AMW-04, and approximately 27 feet per day based on a reported aquifer test (ADEQ 2012; SECOR, 2007b).

3.7.1 Water Levels

Water levels in the UAU have been monitored since April 1992 (Table 2; Appendix D and Appendix E). Monitor wells installed at the Site are screened across both shallow (water table) and deeper intervals within the UAU. Water levels in co-located shallow and deeper screened monitor wells are generally nearly identical.

27

During the period of record for the Site monitor wells, the depth to water has ranged from approximately 21 feet below land surface (bls) in the mid 1990's to approximately 49 feet bls in 2014. The direction of groundwater flow historically has been to the southwest with gradients ranging from approximately 0.005 to 0.008. Vertical gradients between the shallow and deeper zones of the UAU monitored at the Site are generally negligible.

4.0 REMEDIAL INVESTIGATION

RI activities at the 40th Street and Indian School Road Site included groundwater assessment and installation of additional groundwater monitor wells.

4.1 GROUNDWATER ASSESSMENT

Groundwater assessment activities conducted since January 2013 have included collection of groundwater samples for laboratory analysis, water level measurements, and installation of additional groundwater monitor wells. The purpose of these investigations was to address data gaps and further define the extent of VOCs in groundwater beneath the Site. All assessment activities were performed in accordance with work plans submitted to and approved by ADEQ in 2013, and the Quality Assurance Project Plan (QAPP) (H+A, 2013a, 2013b, 2013c, and 2013d).

4.1.1 Monitor Well Installation

Between January 2014 and May 2014, ten (10) groundwater monitor wells (KMW-03, KMW-04, KMW-05, KMW-06, and KMW-07) were drilled and constructed at five (5) locations within the Site boundary (Figure 2). Each location included dual completion of shallow (A) and deep (B) monitor wells.

All drilling was performed using Rotosonic drilling methods (Sonic). At each location the deeper monitor well was first drilled and a continuous core collected to obtain detailed lithologic data. The core was screened for evidence of VOCs with a photoionization detector/flame ionization detector.

Groundwater grab samples were collected during drilling using low-flow methods with a Simulprobe[®] from the borehole per the approved work plan (H+A, 2013c). The clay content of the sediments made it difficult to obtain a viable sample. Additionally, the grab water samples were displaying a strong reaction with the preservative (hydrochloric acid) in the 40 milliliter (mL) glass VOA vials during sample collection. The amount of effervescence from these water samples indicated high in calcium carbonate content and likely affected sample integrity. After attempting several collections of groundwater grab samples yielding questionable results, a decision was made by H+A, in conjunction with ADEQ, to deviate from the work plan and discontinue the groundwater grab sampling during drilling.

After the total depth was reached the boring was reamed from 6 inches to 8-5/8 inches and completed as a monitor well. After completion of the deeper monitor well, the shallow well was drilled and constructed with no coring and or sampling. Lithologic and well construction information are summarized (Table 1; Appendix C).

Monitor wells were constructed with 4-inch diameter Schedule 40 polyvinyl chloride (PVC) well casing. Screen lengths ranged between 25 and 40 feet with 0.020 inch screen slot size.

4.1.2 Groundwater Level Monitoring

Depth to groundwater was measured in all previously existing Site monitor wells in January and September/October 2013. Depth to groundwater was measured in newly installed Site monitor wells in April 2014, with the exception of wells KMW-03A and KMW-03B because they were not installed until May 2014. Subsequently, depth to groundwater was measured in all Site monitor wells in May 2014.

The depth to groundwater measured during the most recent monitoring event in May 2014 ranged from approximately 39.67 to 48.58 feet bls (Table 2). The groundwater elevation ranged from a high of 1166.73 feet msl at AMW-02 to a low of 1153.89 feet msl at KMW-04B. The direction of groundwater flow at the Site is southwest with a hydraulic gradient of approximately 0.007 to 0.008 (Figure 7). Data trends and current drought conditions suggest water levels may be in a period of continuing decline (Appendix E).

4.1.3 Monitor Well Sampling

Groundwater samples were collected from existing and newly installed monitor wells Generally, groundwater samples were collected from existing and newly installed monitor wells using Passive Diffusion Bag (PDB) samplers in accordance with the approved groundwater characterization and well installation work plans (H+A, 2013a and 2013c).

Groundwater samples were collected during three sampling events in 2013 to 2014 (Table 4). Prior to the drilling of additional RI monitor wells, the existing monitor wells (AMW-01 to AMW-04, AMW-06, AMW-08 to AMW-9C, KMW-01 and KMW-02) were sampled in October 2013 to identify data gaps and aid in determination of locations for additional monitor wells. Monitor wells AMW-05 and AMW-07 did not contain sufficient water to be sampled.

FINAL

30

HARGIS + ASSOCIATES, INC.

Generally, samples referred to as "shallow" are collected approximately 2 feet below the groundwater surface, or in deeper screened wells 2 feet below the top of the screen. A sample, referred to as "Deep" is collected near the bottom of the screen interval. If there is a large enough distance between the two samples, an "Intermediate" sample is collected between the "Shallow" and "Deep" sample.

The second sampling event was conducted in April and May 2014, when the newly installed monitor wells (KMW-03A, KMW-03B, KMW-04A, KMW-04B, KMW-05A, KMW-05B, KMW-06A, KMW-06B, KMW-07A and KMW-07B) were sampled. Groundwater samples during this sampling were collected generally at 5-foot intervals along the screen lengths.

The third sampling event occurred in May 2014, when twenty-three Site monitor wells were sampled. These samples were collected at intervals from the "Shallow", "Intermediate", and "Deep" sample intervals described above. Monitor wells AMW-05 and AMW-07 did not contain sufficient water to be sampled.

During the groundwater sampling events conducted in 2013 and 2014, VOCs detected in groundwater include PCE, TCE, and chloroform. PCE was detected in six (6) of the 23 monitor wells sampled at concentrations ranging from 1.0 to 20 μ g/L (Table 4; Figures 5 and 6). Specifically, the following was noted:

- PCE was only detected above 5 μg/L in monitor wells AMW-08 and KMW-01 with maximum concentrations of 20 μg/L and 5.4 μg/L, respectively.
- At monitor wells AMW-01, AMW-06, AMW-09A, and KMW-02, PCE was detected at concentrations below 5 µg/L.
- TCE was detected in a single sample from AMW-08 at a concentration of 1.9 μ g/L, less than the AWQS of 5 μ g/L.
- Low levels of chloroform (between 2.0 and 3.4 µg/L) were detected in newly installed monitor wells KMW-04A, KMW-05A, and KMW-06A.
- Chloroform was detected in all samples collected from KMW-07A and KMW-07B at concentrations ranging from 6.9 to 23 μg/L.

FINAL

4.1.4 Investigation Derived Waste

Investigation derived waste (IDW) was temporarily stored in secure storage containers including a poly tank (development water) and roll off bins (drill cuttings), which displayed Site and investigation information. Prior to disposal, drill cuttings and development water were analyzed for VOCs using EPA Method 8260B, the eight RCRA metals by Toxicity Characteristic Leaching Procedure (TCLP) ; groundwater was also analyzed for flashpoint to 200 °F and pH. All IDW was then transported by Chemical Transportation, Inc. and disposed of at Butterfield Station Landfill in Mobile, Arizona, a certified, licensed disposal facility accepting Non-Hazardous Materials.

5.0 NATURE AND EXTENT OF CONTAMINATION

The following discussion on the nature and extent of contamination constitutes the Conceptual Site Model (CSM). The CSM is based on the CSM presented for the Site in 2008, updated to include results of additional RI Site investigations conducted to date (SECOR, 2008).

5.1 CONTAMINANTS OF CONCERN

PCE is the COC associated with the Site. However, both PCE and TCE have historically been discovered in soil vapor, soil, and groundwater samples collected. The approximate current lateral and vertical distribution of PCE in groundwater at the Site has been identified (Figures 5 and 6). The distribution and concentrations of PCE compared to TCE are much greater. TCE, when detected, is often an order of magnitude less than PCE.

5.2 PHYSICAL AND CHEMICAL PROPERTIES OF TETRACHLOROETHENE AND TRICHLOROETHENE

PCE is a colorless, non-flammable liquid that does not occur naturally in the environment. Its solubility is approximately 206 milligrams per liter, and has a density of 1.62 grams/milliliter (EPA, 2014). Thus, PCE is more dense than water and is considered a dense non-aqueous phase liquid (DNAPL). Approximately 60 percent of the PCE used in the U.S., in 1991, was in the dry cleaning and textile industries (EPA, 1994). Among other applications, PCE is also used in vapor degreasing and metal cleaning operations, and the production of solvent soaps, adhesives, sealants, and as a solvent in various consumer products.

TCE is a colorless, non-flammable liquid that does not occur naturally in the environment. Its solubility is approximately 1,280 milligrams per liter, and has a density of 1.46 grams/milliliter (EPA, 2014, ATSDR, 2007). Thus, TCE is more dense than water and is considered a dense non-aqueous phase liquid (DNAPL). Approximately 80 percent of the TCE used for vapor degreasing of fabricated metal parts and some textiles (ATSDR, 2007). Among other applications, TCE is also used as a solvent in dry cleaning, an intermediate in chemical production, extraction, and as a refrigerant/heat exchange liquid (ATSDR, 2007).

5.3 CONTAMINANT SOURCES

Results of the industrial survey and Site investigations provide evidence of releases and the presence of PCE due to dry cleaning operations at the Kachina Cleaners facility and the former Allen's Cleaners facility. Concentrations of PCE in groundwater greater than 1 percent of the effective solubility of purephase PCE (200,000 μ g/L) can be indicative of the presence of DNAPL in the subsurface (EPA, Office of Solid Waste and Emergency Response [OSWER], 1992, EPA, 2004). Historical concentrations of PCE in groundwater greater than 1 percent of solubility have been observed at monitor wells AMW-01 (37,000 μ g/L in February 1998) and AMW-06 (2,300 μ g/L in May 2002) both located downgradient of the former Allen's Cleaners. The highest reported PCE concentration in groundwater during the May 2014 sampling event was 20 μ g/L. This concentration is well below the 1 percent solubility level, indicating it is likely that no PCE DNAPL is currently present in the subsurface at the Site.

TCE is used in the dry cleaning operations as a pre-cleaning or spotting agent and is also a breakdown product of PCE. TCE is present in soil vapor and groundwater at the Site; however, it is detected less frequently and at significantly lower concentrations than PCE. Concentrations of TCE in groundwater greater than 1 percent of the effective solubility of pure-phase TCE (1,472,000 μ g/L) can be indicative of the presence of DNAPL in the subsurface (OSWER, 1992; EPA, 2004). The highest historical concentration of TCE at the Site in groundwater is 490 μ g/L, which is well below 1 percent of solubility. Therefore, based on available data there is no indication that TCE DNAPL has been present in the subsurface at the Site.

5.4 DISTRIBUTION AND TRENDS OF SOIL VAPOR CONTAMINATION

Historical sampling indicated the presence of PCE in soil vapor in the vicinity of Kachina Cleaners and the former Allen's Cleaners (Table 3; Appendix B). The current distribution of PCE in soil vapor was not evaluated as part of this RI. Historically, PCE in soil vapor has been detected at a maximum value of 460 µg/L from 5 feet to 40 feet bls and a maximum value of 370 µg/L PCE and from 7 feet to 20 feet bls in the vicinity of Kachina Cleaners. The operation of a SVE/AS system at the former Allen's Cleaners from October 2004 to July 2005 removed approximately 33 pounds of PCE. This SVE/AS system significantly decreased PCE in soil vapor at both source areas.

FINAL

5.5 DISTRIBUTION AND TRENDS OF SOIL CONTAMINATION

At the former Allen's Cleaners facility, between 1992 and 1997 45 soil samples were collected between 3 to 30 feet bls and were analyzed for PCE. PCE was detected in seven soil samples at concentrations ranging from 0.040 to 2.750 milligrams per kilograms (mg/kg). Only four (4) samples exceeded the Groundwater Protection Level (GPL) and/or Soil Remediation Level (SRL) for PCE of 1.3 mg/kg and 0.51 mg/kg, respectively (ADEQ (1996) and A.A.C. R18-7, Appendix A). All of these samples were collected adjacent to the north sump, between three (3) to six (6) feet bls, and before the operation of the SVE system noted above. After operation of the SVE system, soil samples were collected adjacent to the north sump and PCE was not detected above the 0.025 mg/kg reporting limit. The deepest detection of PCE in soil was at a depth of 30 feet bls with a reported concentration of 0.188 mg/kg. TCE and cis-1,2-DCE have not been detected in any soil samples.

At the Kachina Cleaners facility, between 1996 and 2006 20 soil samples were collected between five (5) to 40 feet bls and were analyzed for PCE. PCE was detected in five (5) soil samples at concentrations ranging from 0.0018 to 0.12 mg/kg. PCE was not detected above the GPL and/or SRL for PCE of 1.3 mg/kg & 0.51 mg/kg, respectively (ADEQ (1996) and A.A.C. R18-7, Appendix A). The deepest detection of PCE in soil was at a depth of 17 feet bls with a reported concentration of 0.0018 mg/kg. TCE and cis-1,2-DCE have not been detected in any soil samples.

5.6 DISTRIBUTION AND TRENDS OF GROUNDWATER CONTAMINATION

5.6.1 PCE

Concentrations of PCE in groundwater are generally declining in Site monitor wells since monitoring began in 1992 (Table 4; Appendix E). The current distribution of PCE in groundwater suggests a low-concentration plume remains downgradient of the former Kachina Cleaners and the former Allen's Cleaners with a current maximum groundwater concentration of 20 μ g/L (in monitor well AMW-08 located in the source area near Kachina Cleaners) (Figures 5 and 6). PCE was reported at a concentration of 5.4 μ g/L in monitor well KMW-01 in May 2014 immediately downgradient of the Kachina Cleaners source area. PCE concentrations in groundwater samples collected from all other wells in 2013 and 2014 were below the ADEQ AWQS for PCE of 5 μ g/L. The current lateral and vertical extent of the PCE plume appear to be adequately identified in all directions (Figures 5 and 6).

Monitor wells next to and down gradient of former Allen's Cleaners show that PCE concentrations are highest near the surface of the water table and decrease with depth. When compared to similar data for Kachina Cleaners, PCE concentrations increase with depth. This vertical distribution of PCE in groundwater is consistent with a conceptual model that PCE from the Kachina Cleaners has comingled with PCE from former Allen's Cleaners which has migrated downgradient and vertically downward.

5.6.2 TRICHLOROETHENE (TCE)

Historically, concentrations of TCE in groundwater greater than the AWQS were detected between 1992 and 2004 and only from monitor wells AMW-01, AMW-06 and KMW-01. TCE concentrations have declined significantly between the early 2000's to approximately 2006. TCE has not been detected at or above the AWQS of 5 μ g/L since 2004. The highest concentrations of TCE, up to 490 μ g/L, were detected at monitor well AMW-01, located immediately downgradient of the former Allen's Cleaners source area. At KMW-01, concentrations of TCE were higher in samples collected approximately 24 feet below the water table than samples collected at the water table. It is also noted that even though TCE concentrations were generally approximately two (2) percent of reported PCE concentrations, a similar decreasing concentration trend is noted (Figure 8). In samples collected at Site monitor wells in 2013 and 2014, TCE in groundwater is limited to a single detection of 1.9 μ g/L at AMW-08, which is below the established AWQS of 5 μ g/L.

6.0 FATE AND TRANSPORT

6.1 FATE AND TRANSPORT OF TETRACHLOROETHENE AND TRICHLOROETHENE IN SOILS

The fate and transport of PCE and TCE in soil at the Site is largely influenced by the physical and chemical properties of PCE and TCE and the type of subsurface sediments. Processes that primarily affect the mobility of PCE and TCE in soil include dissolution into percolating surface water, sorption, volatilization, and biodegradation.

The Site is underlain by an approximate 25-foot to 40-foot thick vadose zone consisting of interbedded mixed sand, gravel, silt, and clay. Much of the land surface in the vicinity of Kachina Cleaners and the former Allen's Cleaners are covered by asphalt and concrete pavement. Consequently, there appears to be little potential for surface water runoff to infiltrate the surface pavement during and following rainfall events.

Sorption and release from soils is largely dependent on soil type, organic carbon content, temperature, saturation, and salinity. It has been reported that approximately 97 percent of PCE released to the subsurface will undergo sorption in the unsaturated topsoil. Approximately 2 percent of the PCE in the unsaturated topsoil will volatilize into soil vapor. In deeper saturated soils, 26 percent of sorbed mass will leach into the groundwater, and volatilization of dissolved mass back into the soil vapor may occur. Small amounts of anaerobic microbial degradation may also occur in the unsaturated zone (U.S. Air Force, 1989).

The CSM assumes that releases of PCE have occurred in the past, as suggested by the presence of PCE historically detected in soil. The localized high concentrations of PCE in groundwater may have migrated downward through the entire vadose zone thickness existing at that time, reached the capillary fringe, and possibly passed through the capillary fringe into the unconfined aquifer. The less permeable sediments in the then unsaturated zone (i.e., silty clays and clayey silts) may have caused the PCE to adsorb onto the fine-grained sediments and/or were trapped in soil pores surrounded by water, thus leaving some residual PCE in the vadose zone and/or the capillary fringe. In addition, the water levels have declined approximately 20 feet since the late 1990's. As the groundwater elevation in AMW-01 decreased, the concentration of PCE decreased from over 20,000 µg/L to less than 20 µg/L.

It is possible that the observed decreasing PCE concentration trend in groundwater is due to losing contact with any remaining residual PCE adsorbed to soil particles or trapped in soil pores between soil particles in the historical capillary fringe as the water table continued to fall. However, if this were the cause of decreasing groundwater concentrations, elevated soil vapor concentrations would be expected as well; the magnitude of recent soil vapor concentrations do not suggest the presence of residual localized high concentrations of PCE in the vadose zone.

TCE is used in the dry cleaning operations as a pre-cleaning or spotting agent and is also a degradation product of PCE. The CSM assumes that the presence of TCE may be the result of minor releases, degradation of PCE, and or a combination of the two. In the soil at the Site TCE may be transported as a dissolved component of vadose zone moisture down to the groundwater. The presence of less permeable soils in the unsaturated zone may cause TCE to adsorb onto the fine-grained sediments and/or were trapped in soil pores surrounded by water, thus leaving some residual TCE in the vadose zone and/or the capillary fringe. In addition, water levels at the Site have declined approximately 20 feet since the late 1990's, and the concentration of TCE in AMW-01 has decreased from 230 μ g/L to less than 1 μ g/L. It is possible that the observed decreasing TCE concentration trend in groundwater is due to losing contact with the residual TCE adsorbed to soil particles or trapped in soil pores between soil particles in the historic capillary fringe as the water table continues to decline.

6.2 FATE AND TRANSPORT OF TETRACHLOROETHENE AND TRICHLOROETHENE IN GROUNDWATER

Empirical data indicate that the original localized high concentrations of PCE released to the subsurface at the Site has undergone at least some phase transfer, thus resulting in the presence of dissolved-phase PCE in the VOC-impacted aquifer. The highest observed concentrations of dissolved phase PCE in samples from Site monitor wells have been detected in samples from monitor wells AMW-01, AMW-05, AMW-06 and KMW-01. The high concentration of PCE detected in groundwater sampled from monitor well AMW-01 (37,000 μ g/L) and AMW-06 (2,300 μ g/L), suggests that these wells are located near a PCE release source (as previously discussed in Section 6.3).

The fate and transport of PCE and TCE as dissolved compounds is controlled by a number of physical, chemical, and biological processes that are briefly described below. Processes that primarily affect the mobility of dissolved compounds in groundwater include advection, dispersion, diffusion, sorption, and biodegradation.

38

6.2.1 Advection

Advection is the process whereby constituents dissolved in groundwater are transported along with the flowing groundwater. Although it is the most easily understood of the transport processes, it must be evaluated within the context of two main considerations. First, what portion of the fluid in the porous media can be mobilized, and second, what is the true velocity of the groundwater through the porous media. For porous media with relatively high hydraulic conductivities, such as sands, advection is the primary transport mechanism for dissolved constituents.

The rate of groundwater flow is determined based on the hydraulic conductivity of the sediments, the effective porosity of the sediments, and the hydraulic gradient. The horizontal hydraulic conductivity of the UAU at the Site is estimated to range between 1.3 foot/day to 67 feet/day (Earth Tech, 1995; SECOR, 2007b; ADWR, 2009). Published values of total porosity for the types of sediment observed at the Site (silt, mixed sand, and gravel) range from 20 to 50 percent (Fetter, 1994). The effective porosity of the sediments is the pore space through which groundwater moves. The effective porosity is less than the total porosity of the soil, for the purposes of this report it was assumed that effective porosity was approximately 80 percent of total porosity (16 to 40 percent). The historical hydraulic gradient is estimated to range from 0.005 to 0.008. Based on these hydraulic properties, groundwater is estimated to flow west/southwest at a rate of approximately 0.02 foot/day to 3.4 feet/day, with PCE possibly transported via advective processes.

6.2.2 Dispersion and Diffusion

Contaminant plumes tend to spread laterally and longitudinally as they migrate downgradient within the groundwater due to several mixing processes that cause dispersion of the contaminant. Dispersion processes operate both at the pore scale and at the field scale due to variations in pore size and configuration and field scale heterogeneity in hydraulic conductivity. Differences in hydraulic conductivity are a function of the different types of sediment and also may be related to vertical stratification or channel-related deposition of sediments.

Diffusion is a transport process where dissolved constituents migrate from areas of high concentration to areas of low concentration. Diffusion will occur as long as a concentration gradient exists, even when groundwater is not moving. For porous media with relatively low hydraulic conductivities, such as clays, diffusion is the primary transport mechanism for dissolved constituents.

The degree to which dissolved constituents diffuse into low conductivity zones, such as clays, is often a function of how long the constituents have been present in the subsurface.

Conversely, removal of dissolved constituents from low conductivity zones may be limited by the rate at which these constituents can diffuse out of the low conductivity zones.

Dispersion can be measured by injecting a tracer and measuring the concentration at different points over time. However, at most sites (including the subject Site) this kind of testing is not conducted due to the time and effort required to set up a tracer test and because dispersion can vary spatially.

6.2.3 Sorption

As groundwater flows through porous media, dissolved constituents in the groundwater may undergo sorption processes including: adsorption, chemisorption, absorption, and ion exchange (Fetter, 1994). These sorption processes tend to slow the rate at which dissolved constituents travel through the porous media relative to the average linear velocity of groundwater. The phenomenon is termed retardation, and the ratio of the average linear groundwater velocity to the velocity of the dissolved constituent is called the retardation factor. The partitioning of a dissolved constituent between the dissolved phase and solid surfaces is dependent on the chemical properties of the dissolved constituent, the amount of sorbing material present in the aquifer matrix, and the concentration of the dissolved constituents.

Adsorption is the process whereby dissolved constituents cling to a solid surface. Hydrophobic organic compounds adsorb to organic carbon present in the aquifer matrix. The more hydrophobic a compound is, the greater the affinity it has for organic carbon. In general semi-volatile organic compounds/polycyclic aromatic hydrocarbons have a greater affinity for sorption than many VOCs. Total organic carbon (TOC) was measured in nine (9) soil samples collected at depths ranging from 48 to 116 feet bls (SECOR, 2008). TOC ranged from 0.1% to 1.1% of the total weight of sample. Absorption occurs when the aquifer materials are porous enough for dissolved constituents to diffuse into and/or on the particles associated with the sediments and be sorbed onto the interior and exterior surfaces of the particles.

FINAL

Sorption processes may be reversible or non-reversible. For reversible sorption, the net effect of the sorption process is to slow the movement of dissolved constituents and the total mass of the dissolved constituent in the system does not decrease.

6.2.4 Biodegradation

Biodegradation is the process whereby organic compounds are biologically degraded to other compounds, usually by microorganisms. The process by which intrinsic microbial metabolism or cometabolism by indigenous microorganisms within the subsurface results in a chemical or biological transformation of contaminants, and a corresponding reduction of contaminant mass, is called "intrinsic biodegradation". The microorganisms break down the organic compound into different chemical components. Biodegradation may also cause conversion of organic compounds to inorganic compounds. This process is termed mineralization.

Biodegradation rates are highly variable. Biodegradation rates are affected in part by the concentration of the organic compound; the types and number of organisms present; the presence of other compounds; the presence of oxygen; the oxidation-reduction potential; temperature; pH; salinity; composition of the aquifer matrix; and the quantity and quality of nutrients in the aquifer (Weed and Weber, 1974; Kobayashi and Rittman, 1982; Verschueren, 1983; Cheng and Koskinen, 1986).

Biological transformations result in a reduction in the mass of the dissolved constituent being degraded. However, daughter products may be formed which may have different mobility and toxicity characteristics than the parent constituent.

Persistence of PCE in the environment, under all but the most favorable conditions (e.g., high availability of electron donors, anaerobic environment, suitable and robust microbial population, etc.), can be measured in terms of decades. PCE is degraded anaerobically through a process known as reductive dechlorination. Reductive dechlorination is an oxidation-reduction reaction whereby electrons are transferred from a donor (e.g., reduced organic substrate) to a chlorinated hydrocarbon acceptor, thus resulting in the replacement of a chlorine atom on the VOC molecule with a hydrogen atom (Vogel and Criddle, 1987). Under optimal conditions, this process can proceed until all of the chlorine atoms are removed. As this occurs, PCE is dechlorinated in the order of PCE~ trichloroethene (TCE)~ cis-1,2-dichloroethene (DCE)~ vinyl chloride~ ethene (Vogel and McCarty, 1985). It should be noted that, following the reductive dechlorination of PCE to TCE, further degradation may occur either

HARGIS + ASSOCIATES, INC.

aerobically or anaerobically. The efficiency of the PCE bioremediation process is difficult to measure due to such physical processes as adsorption/desorption, advection, mixing, and dispersion. The presence of degradation daughter products in groundwater, and (to a lesser extent) in subsurface soil, is an industry-standard indicator that biodegradation is occurring.

If PCE were being anaerobically biodegraded to TCE, the TCE concentrations would be expected to increase as the PCE concentrations decreased, and likewise, as TCE biodegrades to cis-1,2-DCE. TCE and cis-1,2-DCE have not been regularly detected in monitor wells at the Site (Table 4). Therefore, there does not appear to be any evidence that biodegradation is occurring in the UAU at the Site.

7.0 RISK EVALUATION

7.1 ROUTES OF EXPOSURE

Migration or "exposure" pathways are routes potentially taken by contaminants from the Site as they migrate away from the sources through the environmental media to potential environmental receptors. An exposure pathway is incomplete if any of the following elements is missing (American Society for Testing and Materials, 2003):

- A mechanism of contaminant release from primary or secondary sources;
- A transport medium, if potential environmental receptors are not located at the source; and/or
- A point of potential contact between environmental receptors and the contaminated medium.

Possible migration pathways for a given site might include groundwater, surface water, air, sediment, soils, and biological transport. Descriptions of each of the potential migration pathways are discussed below.

7.1.1 Groundwater

Given the current depth to groundwater (approximately 40 to 50 feet bgs), human receptor contact is improbable. However, a potential groundwater pathway could be established if active groundwater supply wells in the vicinity of the Site were to pump PCE-impacted groundwater to the surface, such as the SRP wells supplying water to the canals for irrigation in the ECP WQARF area. This type of pathway could create a transport mechanism that may allow human receptors located in residential/business communities nearby or served by these supply wells to come in contact with PCE-and or TCE-impacted groundwater.

7.1.2 Surface Water

There are no natural surface water bodies within a 0.75 mile radius of the former Allen's Cleaners and Kachina Cleaners sites. Surface water impacts resulting from facility dry cleaning solvent releases is improbable. However, the ECP Site area irrigation is supplied by the SRP through the lateral canal system which connect to the Arizona and Grand Canals. The canal water is supplied by groundwater pumped from SRP wells (Appendix F).

This type of pathway could create a transport mechanism that may allow human receptors located in residential/business communities nearby or served by canal irrigation to come in contact with PCE-impacted groundwater.

7.1.3 Air

Migration of PCE and or TCE by the air pathway is possible, given their high potential for volatilization from liquid to gas. Given that the Site is covered by asphalt or concrete, a direct exposure pathway from soil gas to potential receptors is improbable and, therefore, considered incomplete. However, a direct exposure pathway could be created if excavation is conducted at the Site or if excavated materials are inadequately containerized pending their proper disposal. An air (soil gas) pathway could still be created if properties adjacent to either the former Allen's Cleaners or the Kachina Cleaners build subgrade structures (i.e., basements, underground parking, and subgrade vaults). Volatilized PCE or TCE then could migrate via soil gas and concentrate in these structures, possibly creating an atmosphere resulting in acute or chronic health affects to human receptors.

7.1.4 Soil and Sediments

PCE-impacted soil has been documented at the Site. A PCE pathway from soil to groundwater has been established as detectable concentrations of PCE in groundwater have been identified. Given that the majority of the Site is covered by asphalt or concrete, a direct exposure pathway from residual high concentrations of PCE adsorbed on soil particles or trapped in pore spaces between soil particles to potential receptors, is incomplete. A direct exposure pathway could be created if excavation is conducted at the Site or if excavated investigative derived waste is inadequately containerized pending proper disposal.

Sediment transport can occur via surface erosion and wind. Most of the Site is covered with asphalt pavement or concrete, thereby forming a barrier between the sediment and potential human receptors. However, there are small portions of the Site that are not covered by pavement or concrete. Where these unpaved areas are within a contaminated zone, they are susceptible to surface erosion and transport of contaminated sediments. Disturbance of sediment within such areas could establish a direct exposure pathway.

FINAL

44

7.1.5 Biota

Biota transport can occur if contaminated groundwater is used in agricultural or livestock practices. There are no operational production wells within a 1,000-foot radius of the Site. Therefore, the biota exposure pathway is incomplete.

7.2 POTENTIAL RECEPTORS

Potential receptors include human and ecological receptors. A description of each of these receptors is discussed below.

7.2.1 Human Receptors

The Site is located in a mixed residential/business district. The nearest residential housing is located approximately 50 feet from both Kachina Cleaners and former Allen's Cleaners. Potential human receptors in the vicinity of the Site include offsite residential populations, site workers, and site visitors. No registered potable or non-potable water wells are located within a 1,000-foot radius of the Site. While unlikely, it is possible for onsite workers and/or visitors to be exposed to PCE- and or TCE-impacted media (soil, groundwater, and investigative derived waste) at the facilities. Site workers and visitors may be exposed to contaminants through dermal contact or ingestion of contaminated soil/groundwater and/or inhalation of contaminant vapors if any vapors or contaminants remain in soil pores or adhered to the soil.

7.2.2 Ecological Receptors

The Site is located in an urban, residential/business district. The properties are mostly covered with asphalt or bare soil. Typical plants in the area are ornamental and native species used for landscaping at business and residential properties. Normal ecological receptors are not considered a factor.

7.3 CURRENT AND FORESEEABLE FUTURE USES OF LAND AND WATER

The land and water uses described in the Land and Water Use Report (Appendix F) most likely to be relevant to the discussion of remedial objectives are presented below.

7.3.1 Land Use

The zoning pattern in the area has been long established and there are no foreseeable changes for the future. Land uses for the Site are expected to remain predominantly residential and commercial.

7.3.2 Groundwater Use

The COP and SRP pump groundwater as needed when surface water supplies cannot meet their customer needs. Current and future groundwater uses within the Site include the following:

- The most accessible alternate water source for COP is local groundwater. The COP currently has no plans to develop groundwater within the Site but will consider the Site area for well development in the future. Therefore, the potential exists for the COP to install future municipal wells within the Site or within one mile of the Site plumes.
- While there are no SRP wells in the immediate vicinity of the Site, SRP operates and maintains seven (7) irrigation wells within one-mile of the 40th Street and Indian School Road Site (Appendix F).

ADWR 55-Registry No.	SRP Well No.
55-202398	18.6E-7.6N
55-607672	17.5E-7N
55-607731	17.1E-7.4N
55-608431	17E-8N
55-617825	18E-8.8N
55-617857	17.9E-7.5N
55-607748	19E-8.1N

The last groundwater sample collected from SRP well 17E-8N in June 2011 contained PCE at a concentration of 2.2 μ g/L, and in April 2013, SRP reported PCE at a concentration of 3 μ g/L in well 17.9E-7.5N (Elliott, 2014). Groundwater quality data collected from these wells indicates that PCE concentrations attributed to the Site in these two SRP wells are below the AWQS of 5 μ g/L. Groundwater pumpage at these wells has been intermittent in the recent past, but the wells can potentially be activated.

• SRP will continue to need the irrigation wells in the Site area to be operational to supplement surface water supplies. SRP has indicated that they may change water usage from irrigation to drinking water within the foreseeable future to accommodate COP needs.

7.3.3 Surface Water Use

Currently, surface water uses within the Site are for residential irrigation and they are likely to remain as such in the future.

8.0 SUMMARY AND CONCLUSIONS

RI activities at the Site included soil sampling, vapor sampling, and installation of additional groundwater monitor wells and groundwater characterization. Results of RI activities have been used to further characterize and reasonably identify the approximate lateral and vertical extent of VOCs in groundwater. PCE has been identified as the COC at the Site, however, TCE has historically been present in Site media. RI activities conducted in 2013 and 2014 included the monitoring of 15 existing groundwater monitor wells and the installation and monitoring of ten (10) additional paired groundwater monitor wells at five (5) locations downgradient of the Kachina Cleaners facility and the former Allen's Cleaners.

In 2013 and 2014 PCE was detected in samples from six (6) of 23 monitor wells. PCE concentrations ranged from 1.0 μ g/L to 20 μ g/L. PCE concentrations detected above the AWQS of 5 μ g/L were reported in samples collected from monitor wells AMW-08 and KMW-01. Of note are the following:

- At monitor well AMW-08, PCE concentrations greater than the AWQS were observed in samples collected from depths of 49.6 feet to 54 feet bls, which corresponds to approximately 2 to 7 feet below the water table.
- Samples collected at 58.3 feet bls in monitor well AMW-08 (approximately 11 feet below the water table) were slightly below the AWQS.
- At KMW-01, concentrations above the AWQS were reported in a sample collected from a depth of 50.5 bls, corresponding to 2 feet below the water table.
- Samples collected at 55.5 feet bls in KMW-01 (or approximately 7 feet below the water table) were slightly below the AWQS.
- PCE was not detected in any of the monitor wells installed in 2013 and 2014 (KMW-03A/B through KMW-07A/B).

The horizontal extent of PCE above the AWQS has been identified in an area downgradient of the former Allen's Cleaners, extending beneath and slightly downgradient of Kachina Cleaners. The maximum PCE groundwater concentration was detected at 20 µg/L in AMW-08 (Figure 7). PCE above the AWQS extends vertically from the water table surface to 11 feet below the water table.

In 2013 and 2014 TCE was detected only in one monitor well at a concentration of 1.9 μ g/L; TCE has not been detected at or above the AWQS of 5 μ g/L since 2004.

The declining concentration trends observed in groundwater and soil vapor and the stability of the current plume configuration are likely the result of attenuation mechanisms such as sorption, dilution, volatilization, dispersion and/or biodegradation and remedial efforts. Due to the minimal amount of PCE remaining in the subsurface, no further remedial action is recommended at this time. However, the following activities are recommended:

- Site groundwater monitor wells remain in the ECP WQARF well network to be monitored on a quarterly basis to provide water level data and to verify the continued attenuation of PCE and TCE in the subsurface.
- Soil vapor from all site wells be monitored semi-annually for the next fiscal year to verify concentrations in the vadose zone remain at a depressed level.

8.1 DATA GAPS

Based on the data obtained from the RI and previous investigations, the following data gap has been identified:

• With the recent slight increase in chemical concentrations in groundwater, additional source investigation is needed to determine whether a continuing source still exists and is impacting groundwater concentrations. The current groundwater and soil vapor monitor well network appears to be sufficient to assess this question.

8.2 REMEDIAL OBJECTIVES

In accordance with A.A.C. R18-16-406(I) and A.A.C. R18-16-406(J), the ADEQ held a public meeting to obtain information for purposes of establishing remedial objectives for the site during the CAB meeting held at Arcadia High School on February 5, 2015. Following the community involvement activities regarding the remedial investigation report and the proposed ROs report, a final remedial investigation report was prepared containing the results of the site characterization and the Remedial Objectives Report which is included in Appendix G.

8.3 REMEDIAL OBJECTIVES RESPONSIVENESS SUMMARY

Pursuant to the requirements of the A.C.C. R18-16-406(I), the ADEQ has prepared this comprehensive responsiveness summary for comments received on the ROs for the 40th Street and Indian School Road WQARF Site, Phoenix, Arizona. Two oral comments and no written comments were received on the ROs during the CAB meeting held at Arcadia High School on February 5, 2015. The RO Responsiveness Summary for the site is included in Appendix H.

8.4 REMEDIAL INVESTIGATION RESPONSIVENESS SUMMARY

Pursuant to the requirements of the A.C.C. R18-16-406(H), the ADEQ has prepared this comprehensive responsiveness summary for comments received on the Draft Remedial Investigation Report, 40th Street and Indian School Road WQARF Site, Phoenix, Arizona dated November 25, 2014, after being available for a 60-day period of public review and comment. No comments were received for this report. The RI Responsiveness Summary for the site is included in Appendix I.

HISTORICAL GROUNDWATER ELEVATIONS

		Reference			
		Point	Depth to	Water Level	
Well Identifier	Date	Elevation (a)	Water	Elevation	
(Screen Interval)	Measured	(feet msl)	(feet bls)	(feet msl)	Notes

Hydro Geo Chem, Inc. Results of Groundwater Investigation, Former Allen's Cleaners Facility, dated 2/17/98.
 FD GTI calculated groundwater elevations at AMW1 and AMW2 corrected to most recent MPE.

2 = FD GTI measured DTW suspect; measurements indicated have been adjusted by Stantec (formerly SECOR) based on available data.

3 = On 3/21/02, a blockage was measured at ~34.7 feet below MPE. On 4/24/02, air injection was utilized to clear the well to approximately 42 feet below ground surface.

4 = On 3/21/02, a blockage was measured at ~31.2 feet below MPE. On 4/24/02, air injection was utilized to clear the well to 50 feet below ground surface.

5 = On 3/21/02, a blockage was measured at ~26.6 feet below MPE. On 4/24/02, air injection was utilized to clear the well to approximately 47 feet below ground surface.

6 = On 4/24/02, a 2-inch diameter well was installed inside the existing 4-inch diameter well due to a suspected casing break.

7 = Wells were gauged to examine the influence of pumping the SRP well located at 32nd Street and Indian School Road.

8 = PDB cable in well; 4/24/02 - 2" installed in 4" well. 3/21/02 well blocked at 26.6'; 4/24/02 air injection used to clear well to 47', install 2" well.

9 = PDB cable in well; paired w/shallow(17.4'td) 2" well

NOTE: Detections are shown in **BOLD** type.

(1) = Sample dilution required.

(2) = Sample results reported as ppmV on laboratory report.

FOOTNOTES

bls = Below land surface

PCE = Tetrachloroethylene

TCE = Trichloroethylene

cis-1,2-DCE = cis-1,2-Dichloroethylene

(<) = Less than; the value is the Limit of Detection for that compound

NA = Not analyzed or not available

DUP = Duplicate sample

ppmV = Parts per million by volume (or volumetric)

March 10, 2014

Ana I. Vargas, Manager Remedial Projects Section Arizona Department of Environmental Quality 1110 W. Washington Street Phoenix, Arizona 85007

Re: Final Letter Report – Remedial Investigation ECP 40th Street and Indian School Road WQARF Registry Site Contract No. 13-048324, ADEQ Task Assignment No. 14-055490 HGL Project No. AR8003

Dear Ms. Vargas:

On November 19, 2013, the Arizona Department of Environmental Quality (ADEQ) requested that HydroGeoLogic, Inc. (HGL) support the preparation of the Remedial Investigation report for the East Central Phoenix (ECP) 40th Street and Indian School Road Water Quality Assurance Revolving Fund (WQARF) Registry Site (site). ADEQ tasked HGL to draft a letter report that summarizes the history of the WQARF site, including facilities located within the site boundary and information about their operations, chemical use, waste stream, releases, and regulatory involvement.

This letter report is divided into five sections. The first section provides background on the ECP 40th Street and Indian School Road WQARF site, including the site location and contaminants of concern (COC). The second section provides an operational history of the site. The third section discusses regulatory involvement at the site, and the fourth section provides an overview of the ownership history of the site. A conclusion is provided to summarize operator and owner activities.

Documents used to draft this letter report have been assigned a six-character alpha code according to the source from which they were obtained and have been numbered sequentially within each source. When a document consisted of more than one page, each page rather than each document was numbered. These alpha codes and numbers follow a statement or group of statements and designate the source document(s) from which the information was extracted. The source documents can be found on the enclosed CD-ROM (Enclosure 1).

Ms. Vargas March 10, 2014 Page 2 of 18

ECP 40th STREET AND INDIAN SCHOOL ROAD WQARF SITE BACKGROUND

The ECP 40th Street and Indian School Road WQARF site is one of six ECP WQARF sites. The current site plume is bounded by Devonshire Avenue to the north, 40th Street to the east, East Piccadilly Road to the south, and 38th Place to the west [FSDEQW 1].¹ See enclosed Figure 1 for the site location (Enclosure 2).

The original ECP 40th Street and Indian School Road WQARF study area investigation began after the 1989 discovery of tetrachloroethene (PCE) in a soil vapor sample taken north of Kachina Cleaners and Laundry, Inc. (Kachina Cleaners) at 16.5 feet below ground surface (bgs). The concentration of PCE in the soil vapor sample was 270 micrograms per liter (μ g/L). Another soil vapor sample was taken north of the former Allen's Cleaners and Laundry, Inc. (Allen's Cleaners) at 15.2 feet bgs. PCE was detected in that sample at a concentration of 370 μ g/L [FSDEQW 1].

In 1997, groundwater, soil, and soil vapor surveys were conducted at the former Allen's Cleaners. PCE in groundwater was detected at concentrations up to 316 μ g/L. Soil samples did not contain detectable concentrations of PCE. Soil vapor concentrations of PCE ranged from 0.13 μ g/L to 33 μ g/L. Also in 1997, ADEQ installed four groundwater monitoring wells west of the former Allen's Cleaners. Initial groundwater samples collected from these wells reported a maximum PCE concentration of 1,800 μ g/L. ADEQ also collected groundwater and soil samples in the vicinity of Kachina Cleaners in 1997. PCE in groundwater was detected with concentrations up to 800 μ g/L. The soil samples did not contain detectable concentrations of PCE [FSDEQW 2].

In 1998, the ECP 40th Street and Indian School Road study area was placed on the WQARF Registry with a score of 20 out of a possible 120 [FSDEQW 2].

A 2002 ADEQ groundwater sampling event showed the continued presence of PCE above the 5 μ g/L Arizona Aquifer Water Quality Standards (AWQS) limit at the site. In 2003, ADEQ installed a groundwater monitoring well in the alley between the former Allen's Cleaners and Kachina Cleaners. ADEQ also installed three soil vapor extraction (SVE) wells and six air sparge (AS) wells at the former Allen's Cleaners as part of an early response action. In 2005, the SVE/AS system was decommissioned and removed from the former Allen's Cleaners. The SVE/AS system had removed approximately 33 pounds of PCE from the vadose zone throughout its operation [FSDEQW 2-3].

In 2007, ADEQ sent out notices per Arizona Revised Statutes § 49-287.03, initiating the Remedial Investigation for the site, and installed an additional groundwater monitoring well on 39th Street, north of Indian School Road. In 2008, ADEQ installed two more groundwater wells: one on 39th Street, north of Indian School Road, and one on Monterosa Street, south of the former Allen's Cleaners. Concentrations of PCE were still detected above the AWQS limit

¹ The plume depicted in Figure 1 has been updated by HGL based on October 2013 sampling data provided by ADEQ. The current groundwater plume extends just to the east of 40th Street, which is noted as the eastern plume boundary on ADEQ's most recent site narrative in July 2012 [FSDEQW 1].

Ms. Vargas March 10, 2014 Page 3 of 18

of 5 μ g/L. From 2009 to 2012, ADEQ did not conduct work at the site [FSDEQW 3]. In October 2013, ADEQ began additional well installation and groundwater sampling activities [FSDEQP 3204-3247].

CONTAMINANTS OF CONCERN

The current contaminants of concern (COCs) at the site are PCE and trichloroethene (TCE) [FSDEQW 4].

OPERATIONAL HISTORY

Kachina Cleaners

The Kachina Cleaners property, located at 3926 East Indian School Road, was purchased by the Tsantilas family in 1955 as vacant land [FSDEQP 2782].² On November 13, 1956, a permit for the site was issued to Alden Tyson for the installation of one dry cleaning unit that used nonflammable solvent [FSFDPX 78]. The nature of Mr. Tyson's connection to Kachina Cleaners has not been determined. Despite a permit for dry cleaning being issued for the 3926 East Indian School Road site in 1956, Kachina Cleaners did not begin dry cleaning operations at the site until 1959, when the main building was constructed [FSDEQP 2782].

Kachina Cleaners was incorporated in Arizona on April 19, 1961, as a public laundry and dry cleaning service as well as a coin-operated laundromat. The business was started in 1959 by James Tsantilas. In 1961, control of the business was ceded to Constantine Tsantilas (chief executive officer and president), Bessie Tsantilas (vice president), and Stella Tsantilas (secretary/treasurer) [FSDEQP 2389-2390].

Dry cleaning equipment was located at the north end of the main building beginning in 1959. In 1964, a second, smaller building was constructed north of the main building to house steam boilers and offices [FSDEQP 2782]. According to a 1992 Dun & Bradstreet report, Kachina Cleaners employed 14 people and occupied 3,200 square feet in a one-story concrete block building owned by the corporate officers [FSDEQP 2389-2390].

According to a June 1996 site characterization report prepared by Earth Tech, Inc. (Earth Tech), Kachina Cleaners reportedly used 40 to 50 gallons of PCE per week.³ Wastewater passed through filters prior to being discharged to the sewer system, which Kachina Cleaners was reportedly connected to in the early 1960s. The spent filters were removed and disposed of by Safety-Kleen Corporation (Safety-Kleen). Waste PCE fluids were distilled for recycling, and leftover amounts of PCE were handled and disposed of by Rinchem Company, Inc. [FSDEQP 2782].

² The source document, a 1996 site characterization report prepared by Earth Tech, Inc., states that the Tsantilas family purchased the Kachina Cleaners property in 1953; however a warranty deed for the property was not signed until 1955 by James and Bessie Tsantilas [FSDEQP 2782; FSNETR 35-36]. HGL will use the deed document date as the date of ownership.

³ The exact time period for which this volume of PCE use applies is unclear.

Ms. Vargas March 10, 2014 Page 4 of 18

Before being connected to the sewer system, Kachina Cleaners used two cesspools and a septic tank for wastewater disposal. According to the 1996 site characterization report, the cesspools and septic tank were reportedly no longer in use, but were still present. They were located northwest of the main building. In addition, a lint trap was located just south of the septic tank [FSDEQP 2782].

On February 25, 1975, Kachina Cleaners was issued permit 11921 for the operation of a Class III dry cleaning plant. The permit was signed by Stella Tsantilas [FSFDPX 77].

A January 18, 1985, occupancy activity report from the City of Phoenix Fire Department notes the following 13 fire code violations [FSFDPX 37, 39-40]:

- Failure to complete hazardous materials application form;
- Failure to obtain a revised permit to operate a Class III dry cleaning plant;
- Failure to obtain a permit for the use and storage of hazardous chemicals;
- Failure to obtain a permit for the use and storage of flammable liquids;
- Failure to remove accumulated waste/empty containers from the storage room, properly label containers, and store paint and chemicals on stable shelving;
- Failure to remove stacked combustibles and dust from area surrounding dry cleaning equipment;
- Failure to remove all PCE drums from the interior of the building, as no open containers are allowed inside the building;
- Failure to cover the reclaiming tank behind the dryers with a completely sealed lid;
- Failure to repair a broken electrical outlet behind a vending machine;
- Failure to post National Fire Protection Association fire diamonds on the front of the dry cleaning building and on the fenced storage area containing PCE;
- Failure to label all containers with a product's chemical name;
- Failure to store oxidizers in closed containers and to separate them from other material; and
- Failure to safely store flammables.

On March 2, 1985, permit 38461 was issued by the City of Phoenix Fire Department for the storage and handling of flammable/combustible liquids and for the storage and handling of hazardous chemicals/materials [FSFDPX 36].

Kachina Cleaners filed its first U.S. Environmental Protection Agency (EPA) notification of hazardous waste activity form on April 24, 1986. The facility was listed as a small quantity generator (less than 1,000 kilograms [kg] per month) of hazardous waste (EPA hazardous waste codes F001 and F002) [FSDEQP 2376-2377].⁴

⁴ EPA hazardous waste code F001 represents spent halogenated solvents used in degreasing, including PCE and TCE, among other constituents. EPA hazardous waste code F002 represents spent halogenated solvents, including PCE and 1,1,1-trichloroethane, among other constituents [GDEPAW 2].

Ms. Vargas March 10, 2014 Page 5 of 18

On August 26, 1991, Kachina Cleaners submitted an application for a Maricopa County air quality permit to install one dry-to-dry Multimatic mercury dry cleaning machine with a capacity of 15 pounds (lbs). A 30-ton cooling tower, built-in refrigerated coiling coils, and spin filter were part of the dry cleaning machine. In addition, one gas-fueled Western boiler was listed on the permit application [FSMCAQ 154-169].

A September 21, 1998, Maricopa County application for a non-Title V air quality permit indicates that Kachina Cleaners had two pieces of fuel-burning equipment: one Raynak hot water heater installed in 1974, and one horizontal return tubular boiler installed in November 1991. As for dry cleaning equipment, Kachina Cleaners had one Multimatic Shop Star 500 dry-to-dry cleaning machine installed in October 1996. According to the 1998 application, approximately 300 to 400 gallons of PCE per year were being used in the Multimatic Shop Star 500 dry cleaning machine, which has a capacity of 65 lbs. The equipment also had a cooling tower with 10 tons of cooling capacity and built-in refrigerated condensing coils. A handwritten note calculated the emissions of various constituents, including PCE, which was 8,100 lbs per year, or approximately 22.2 lbs per day [FSMCAQ 118, 120, 122, 124].

Maricopa County air quality permit 980665 was issued to Kachina Cleaners on March 9, 1999, with a renewal date of March 31, 2004 [FSMCAQ 135]. Permit conditions indicated that PCE emission limits were 23 lbs per day, or 8,100 lbs per year. Additionally, Kachina Cleaners was limited to consuming 50 gallons of PCE per month, and no more than 600 gallons per year [FSMCAQ 174].

Kachina Cleaners submitted applications to the Maricopa County Air Quality Department to operate and/or construct a dry cleaning operation on July 2, 2003, and January 20, 2006. Both applications list one piece of equipment, a 65-lb capacity Multimatic Shop Star 500 dry cleaning machine installed in October 1996.⁵ The dry cleaning machine was located on the west side of the main building. According to the applications, Kachina Cleaners was a high-volume PCE dry cleaner, using more than 140 gallons of PCE per year, but less than 2,100 gallons per year. Because the equipment was installed after December 9, 1991, gas vapor generated by the equipment was routed through a refrigerated condenser. The July 2, 2003, application lists one Lattner boiler installed in 1991 and one Raytherm boiler installed in 1970. Both boilers were located in the boiler room/office building on the north side of the property. The January 20, 2006, application lists one Lattner "30HP" boiler installed in March 2004 and one Raytherm boiler installed in approximately 1968. The July 2, 2003, application notes that the coin-operated laundry was located in the southwest corner of the main building, next to the restrooms. A store room was located in the northwest corner of the main building, and the production area was located along the eastern half of the main building [FSMCAQ 92-116].

Kachina Cleaners submitted a letter on June 19, 2006, to the Maricopa County Air Quality Department to request that a Union L860 Perc Dry Cleaning machine be added to its air quality permit [FSMCAQ 126]. The permit was revised on January 11, 2011, with a new

⁵ The January 20, 2006, application states that the Multimatic Shop Star 500 was installed in November 1996 [FSMCAQ 94].

Ms. Vargas March 10, 2014 Page 6 of 18

renewal date of January 16, 2016. The equipment listed under this permit included one 65-lbsper-hour Union L860 PCE dry-to-dry cleaning machine, one 65-lbs-per-hour Multimatic Shop Star 500 dry-to-dry cleaning machine, one 1,255,000-British thermal unit (BTU)-per-hour Lattner boiler, and one 749,800-BTU-per-hour Raytherm boiler [FSMCAQ 222, 228].

Hazardous waste manifests from December 5, 2007, to December 4, 2009, indicate that approximately 5,046 lbs of waste PCE (EPA waste codes D039 and F002) were collected by Univar USA, Englund Equipment Co., SLT Express, Univar USA, Inc., and American Trucking, Inc., and taken to either a Systech Environmental Corporation facility in Fredonia, Kansas, or a U.S. Ecology facility in Beatty, Nevada [FSDEQP 2351-2375].⁶

A June 30, 2011, City of Phoenix Fire Department inspection report notes that chemicals were only located in tanks at the dry cleaning machines and that spot removers were located in a metal cabinet. The inspection report states that normal chemicals for dry cleaning were used and that no violations had been found [FSFDPX 35]. As of 2014, Kachina Cleaners is still operating at 3926 East Indian School Road [FSINET 1].

Allen's Cleaners

Allen's Cleaners operated a dry cleaning facility at 4129 North 40th Street from 1969 to 1989. Allen's Cleaners used PCE as a dry cleaning solvent during its operations; however, waste disposal at the facility was not documented until 1987, when Safety-Kleen was retained to transport and dispose of dry cleaning waste products [FSDEQP 2678, 2717].

A December 29, 1993, site assessment and analytical data summary letter from Gulf-Pacific Environmental Engineering, Inc. (Gulf-Pacific) to ADEQ indicates that no aboveground storage tanks were found to exist on the former Allen's Cleaners property. However, an underground vault was located in the northeast corner of the laundry just inside the rear doors. The plumbing in the area of the vault consisted of a 4-inch cast iron sewer service line that passed near the west side of the vault at a depth of 5.5 feet. However, there was no fluid connection between the vault and the sewer. The vault collected drainage from a floor drain connected to a vent pipe located on the east wall of the facility. A second vent line originating in the laundry area ran along the north wall and connected with the vault. This line had no physical connection to the sewer, and the access drains to this line were capped. The vault and plumbing were removed, broken down, and placed in drums by Gulf-Pacific in November 1993 [FSDEQP 2546-2547].

According to the December 29, 1993, letter, the analytical results of the excavated materials suggested the following:

The only evidence of a potential release is from the vault itself. This evidence suggests very low quantities were released and does not support the wide area contamination reported in

⁶ EPA hazardous waste codes D039 represents a waste that contains PCE. EPA hazardous waste code F002 represents spent halogenated solvents, including PCE and TCE, among other constituents [GDEPAW 1-2].

previous studies. A small amount of staining was observed in the matrix of the vault and low levels of contamination was [*sic*] documented through the analytical results of samples collected [FSDEQP 2547].

Allen's Cleaners operated at the site until 1989. Some additional information regarding operations at Allen's Cleaners is available, but considered privileged at this time and, as a result, is not included in this letter report.

REGULATORY INVOLVEMENT HISTORY

Kachina Cleaners

An October 1988 draft Phase I report prepared by Earth Tech identified Kachina Cleaners as a high potential source of chemical contamination detected in Salt River Project (SRP) Well 17.9E-7.5N because it was located approximately 0.5 mile north of the well and had documented use of PCE.⁷ According to the 1988 Phase I report, the concentration of PCE detected in SRP Well 17.9E-7.5N was 66.0 μ g/L, which exceeded the Arizona action level of 1.0 μ g/L, making the well a high priority for remedial efforts. The report also identified Kachina Cleaners as a medium potential source of contamination in another well, SRP Well 17E-8N, located approximately 1 mile east of Kachina Cleaners. PCE had been detected in this well at a concentration of 8.7 μ g/L. The report notes that during field reconnaissance Earth Tech personnel observed two 55-gallon drums of PCE stored in an enclosed, secured area behind the facility. These drums appeared to be in good condition, with closed lids and clear labels. According to the 1988 Phase I report, 180 to 240 pounds of PCE per month were being transported from this facility to Safety-Kleen for disposal. In addition, the 1988 draft Phase I report notes that there were no records of any Resource Conservation and Recovery Act compliance actions pertaining to Kachina Cleaners [FSDEQP 2396, 2406, 2450-2451, 2527].

In October 1989, a soil gas survey was conducted by Earth Tech in the ECP WQARF study area, and a sample was taken at Kachina Cleaners because of its known PCE use. The soil gas sample was taken at a depth of 16.5 feet bgs on the north side of the facility and PCE was detected at 270 μ g/L [FSDEQP 2680; TIDEQP 1305-1306, 1312].

In May 1994, Earth Tech conducted groundwater sampling at seven dry cleaning facilities based on results of the 1989 soil gas sampling.⁸ The monitoring well at Kachina Cleaners (KMW1) was located 40 feet downgradient of the facility on an adjacent property and drilled to a depth of 60 feet bgs. One sample and a duplicate were collected. PCE was detected at 55 μ g/L and 58 μ g/L, respectively, while TCE was detected at 1.4 μ g/L in both samples. The PCE concentrations exceeded the EPA maximum contaminant level (MCL) and AWQS limit

⁷ The source document initially identifies this well as SRP Well 17.4E-7.5N, but then subsequently refers to it as SRP Well 17.9E-7.5N [FSDEQP 2449-2450]. HGL has confirmed that SRP Well 17.9E-7.5N is the well located within the 40th Street and Osborn Road WQARF site [FODEQP 294-303].

⁸ Of the seven facilities, only Kachina Cleaners and Allen's Cleaners are located within the ECP 40th Street and Indian School WQARF site addressed by this report.

Ms. Vargas March 10, 2014 Page 8 of 18

of 5.0 μ g/L, while the TCE concentrations were below the EPA MCL and AWQS limit of 5.0 μ g/L. [FSDEQP 2888-2899].

In December 1994, groundwater samples were taken at KMW1. PCE was detected at 130 μ g/L and TCE was detected at 2.3 μ g/L [FSDEQP 2919, 2924-2925]. On March 29, 1996, an access agreement was executed between ADEQ and Kachina Cleaners. The agreement allowed ADEQ access to the Kachina Cleaners property for investigation activities and remedial actions regarding soil and groundwater contamination potentially located at or near the facility [FSDEQP 2880-2884].

During a May 1996 site investigation, Earth Tech advanced eight soil borings to approximately 17 feet bgs in the parking lot north and west of the Kachina Cleaners main building and one inside the building. See Figure 2 (Enclosure 3). Soil vapor samples were collected at 5, 10, and 15 feet bgs. PCE was detected in soil vapor at all depths. In the parking lot borings, PCE was detected at levels ranging from 4.2 μ g/L to 460 μ g/L, with the highest concentrations detected at all depths in the borings located immediately to the west and north of the building. Ten soil samples and one duplicate sample were also collected as part of the site investigation. The samples were collected at 7, 12, or 17 feet bgs. Four soil samples (three collected at 7 feet bgs and one collected at 17 feet bgs) were found to have PCE detections at levels above the laboratory reporting limit of 1 microgram per kilogram ($\mu g/kg$) (0.001 milligram per kilogram [mg/kg]). These four soil samples coincided with the samples containing the highest soil vapor results for PCE as well as with the sample taken inside the Kachina Cleaners building. PCE in soil ranged from 3.3 to 5.6 μ g/kg (0.0033 to 0.0056 mg/kg) in the three samples collected at 7 feet bgs. The fourth soil sample was collected at 17 feet bgs and was found to contain 1.8 μ g/kg (0.0018 mg/kg) of PCE. Despite having PCE detections in soil, all PCE sample results were below the non-residential soil remediation level (SRL) of 13 mg/kg and the groundwater protection level (GPL) of 0.80 mg/kg [FSDEOP 2781, 2785-2790; GDDEOW 27, 40].

The May 1996 site characterization investigation suggested that the source of contamination may have been removed. According to the investigation, the origin of the PCE contamination had been the dry cleaning equipment located inside the west wall of the building, the facility sewer line, and the former septic systems at the northwest corner of the building. In addition, the lint trap located near the northwest corner of the building may have been a source of the PCE contamination, according to the site characterization investigation. PCE and TCE contamination had been detected in one monitoring well, KMW1, located west of the facility. However, there was no well upgradient from Kachina Cleaners that could be used to confirm that the PCE and TCE detected in groundwater had originated from the facility [FSDEQP 2793, 2795-2796].

During a May 1997 hydropunch investigation, soil boring HP-AC3 was installed approximately 270 feet west of monitoring well KMW1. Soil samples collected from 45 and 60 feet bgs did not contain PCE at concentrations at or above the method detection limit (MDL) of 0.05 mg/kg. In situ groundwater samples were collected at approximately 30, 75, 90 and 105 feet bgs. Dissolved-phase PCE was detected in the samples collected from 30 feet bgs (800 μ g/L) and 75 feet bgs (2.42 μ g/L) [FSDEQP 2680-2681].

Ms. Vargas March 10, 2014 Page 9 of 18

Inspections of the two dry cleaning machines were conducted by the Maricopa County Air Quality Department between March 2000 and February 2009. Average use of PCE was reported as being between 25 and 40 gallons per month. No violations were reported during any of the inspections, and the facility was in compliance with all regulations. However, a January 31, 2002, inspection included a "notice to correct" statement asking Kachina Cleaners to conduct weekly maintenance checks instead of biweekly checks [FSMCAQ 136-146, 210-213].

In May 2006, groundwater monitoring well KMW2 and three additional soil borings (KSB1 through KSB3) were installed near the Kachina Cleaners facility to further assess the vertical and lateral extent of PCE and TCE in soil, soil gas, and groundwater. Laboratory analysis detected PCE in soil above the method reporting limit (MRL) in only one sample. The sample from boring KSB3 taken at 10 feet bgs contained 0.12 mg/kg of PCE, which was below the non-residential SRL of 13 mg/kg and the GPL of 0.80 mg/kg. Concentrations of PCE were reported in in situ groundwater samples collected at 52 to 54 feet bgs from all four drilling locations. These PCE concentrations ranged from 1.2 μ g/L (in the KSB3 sample). Soil vapor samples were collected from all four borings, and concentrations of PCE were detected in all samples [FSDEQP 2681; GDDEQW 27, 40].⁹

On March 7, 2006, an environmental access agreement was executed between ADEQ and Constantine and Stella Tsantilas, as trustees of the Constantine Tsantilas and Stella Tsantilas Revocable Trust (owners of Kachina Cleaners). The agreement granted an easement to ADEQ for conducting remedial, response, and corrective actions at the Kachina Cleaners facility. The agreement is described as a covenant running with the property, binding any successive property owners or tenants and terminating upon ADEQ's discretion [FSDEQP 2538-2545].

An order of abatement by consent regarding permit G03447 was executed on August 8, 2007, between Kachina Cleaners and the Maricopa County Air Quality Department. The order states that on June 20, 2007, the Maricopa County Air Quality Department issued Kachina Cleaners a notice of violation for failure to submit an annual emissions inventory report for 2006. In consideration for not pursing criminal or civil actions against Kachina Cleaners, the company agreed to pay a one-time fee of \$660 to the Maricopa County Air Quality Department and comply with all Maricopa County Air Pollution Control regulations. Payment of the fee, which occurred on August 8, 2007, constituted appropriate resolution of the violations [FSMCAQ 147-153].

An August 2007 fluid level monitoring report, prepared by SECOR International Inc., provides a summary of groundwater sampling results from 1994 to 2007 for VOCs detected in monitoring wells KMW-1 and KMW-2 near the Kachina Cleaners facility. Table 1 below highlights the PCE and TCE results above AWQS limits. Note that no results exceeding AWQS limits were recorded from well KMW-2 [FSDEQP 2667].

⁹ The source document does not provide further details regarding the concentrations of PCE in the soil vapor samples.

Table 1

Monitoring	Year	Sample Depth	PCE	TCE
Well		(Feet)	$(\mu g/L)$	$(\mu g/L)$

PCE and TCE Groundwater Concentrations Exceeding AWQS Limits at Kachina Cleaners, May 1994 to March 2007*

* = Sampling was not reported for 1995 or for 1999 to 2001.

NA = Not available.

= Results not detected above AWQS limits.

Ranges of data indicate more than one sampling event occurred in the year.

Allen's Cleaners

In October 1989, a soil gas survey was conducted by Earth Tech in the ECP WQARF study area, and a sample was taken at Allen's Cleaners because of its PCE use. The soil gas sample was taken at a depth of 15.2 feet bgs. PCE was detected at a concentration of 370 μ g/L [TIDEQP 1305-1306, 1312].

In April 1992, Earth Tech drilled five soil borings (AB-1 through AB-5) north of the former Allen's Cleaners and one soil boring (AB-6) to the west and downgradient of the facility. Borings AB-1 and AB-2 were drilled by hollow stem auger to a depth of 26 feet bgs. Borings AB-3 and AB-4 were drilled by hand auger to a depth of 13 feet bgs. Boring AB-5 was drilled by hand auger to a depth of 8.5 feet bgs. Boring AB-6 was drilled to a depth of 61 feet bgs and later completed as groundwater monitoring well AMW1 with a screen interval of 20 to 60 feet bgs. See Figure 3 (Enclosure 4) for sampling locations. Soil samples were collected at depths ranging from 5 to 15 feet bgs in AB-1 and AB-2; 4.5 to 8.5 feet in AB-3 through AB-5; and 10 to 30 feet bgs in AB-6. Laboratory analysis of the soil samples identified the presence of PCE in two samples: AB-2 collected at 5 feet bgs with a concentration of 52 μ g/kg (0.052 mg/kg); and AB-6 collected at 30 feet bgs with a concentration of 188 μ g/kg (0.188 mg/kg). Both of these sample detections were below the non-residential SRL for PCE of 13 mg/kg and

Ms. Vargas March 10, 2014 Page 11 of 18

the GPL for PCE of 0.80 mg/kg. A groundwater sample was collected from AMW1 on April 21, 1992. Laboratory analytical results identified dissolved-phase PCE and TCE at concentrations of 8,700 μ g/L and 80 μ g/L, respectively, well above the AWQS limit of 5 μ g/L for both PCE and TCE. A May 22, 1992, groundwater sampling event found PCE in AMW1 at 12,000 μ g/L, with 10,000 μ g/L in a duplicate sample. TCE was not detected above the laboratory detection limit in the May sampling events, but that limit was set at 100 μ g/L [FSDEQP 2682; GDDEQW 27, 40; TIDEQP 1825-1836].

In June 1992, Earth Tech installed a second groundwater monitoring well (AMW2) upgradient from the former Allen's Cleaners and a third groundwater monitoring well (AMW3) 0.25 mile south of the former Allen's Cleaners, approximately 200 feet west of 40th Street on Clarendon Avenue. Both wells were drilled to a depth of 60 feet bgs and screened at 20 to 60 feet bgs [FSDEQP 2682; TIDEQP 1833-1836].¹⁰

Sampling of wells AMW1 through AMW3 occurred in July and August 1992. Analytical results for PCE and TCE concentrations are summarized in Table 2. See Figure 3 (Enclosure 4) for sampling locations [FSDEQP 2919, 2923].

Monitoring Well	Date Sampled	PCE (µg/L)	TCE (µg/L)
AWQS Limit		5	5
AMW1	07/02/1992	15,000	230
	08/11/1992	5,900	120
AMW2	07/12/1992	0.5	<0.2
	08/10/1992	3.4	<0.2
AMW3	08/10/1992	<0.2	<0.2

 Table 2

 Allen's Cleaners Groundwater Sample Results, July and August 1992

In May 1993, ADEQ conducted a hazardous waste inspection of the former Allen's Cleaners facility. During this inspection, ADEQ identified two deep sump structures located along the east wall of the facility. Based on the presence of solvent-like odors emanating from the sumps, ADEQ collected five sludge samples from the sumps and one background soil sample. The background soil sample was collected in the alley approximately 200 feet northeast of the building. According to ADEQ, four of the six sludge samples contained TCE and "unidentified analytes," and PCE was found in the background sample. The actual concentrations were not provided in the ADEQ hazardous waste inspection report. The sump contents were removed by Chem Waste on June 14, 1993 [FSDEQP 2682-2683].

In the summer and fall of 1993, Gulf-Pacific conducted a series of investigations into the sumps noted above and the sewer line located to the north of the former Allen's Cleaners. Additionally, an SVE system was established in a nested vapor extraction well located near the northernmost sump. Laboratory analysis of a sludge sample collected from the northernmost

¹⁰ Note that AMW3 is not depicted on Figure 3 (Enclosure 4).

Ms. Vargas March 10, 2014 Page 12 of 18

sump identified the presence of PCE (977.9 mg/kg), TCE (4.20 mg/kg), and 1,1,1-trichloroethane (1,1,1-TCA) (5.70 mg/kg).¹¹ Following removal of the sump, a soil sample was collected at approximately 6 feet bgs from a boring placed within the excavation. PCE was detected in this sample at a concentration of 2.75 mg/kg. Four borings were advanced along the sewer line to the north of the building. Soil samples were collected at 5.5 and 7 feet bgs. None of the soil samples collected along the sewer line contained PCE above laboratory MRLs. During operation of the SVE system, vapors were extracted from the shallow and intermediate depth wells at a calculated extraction rate of 0.22 pounds of PCE per day. Documents obtained by HGL do not indicate how long the SVE system operated or how much PCE was removed from the soil beneath the former sump structure [FSDEQP 2546, 2548-2549, 2683, 2712, 2724-2725].

A December 1994 groundwater sampling event for monitoring wells AMW1, AMW2, and AMW3 at the former Allen's Cleaners found a range of PCE and TCE concentrations. Table 3 summarizes the sampling results for PCE and TCE. See Figure 3 (Enclosure 4) for sampling locations [FSDEQP 2919, 2923].

Monitoring Well	PCE (µg/L)	TCE (µg/L)
AWQS Limit	5	5
AMW1	31,000*	<500
AMW1D	24,000	490
AMW2	12	< 0.50
AMW3	<0.5	< 0.50

Table 3
Allen's Cleaners Groundwater Sample Results, December 16, 1994

D = Duplicate sample.

*The table and figure in the source document identifies the PCE concentration at AMW1 as 31,000 μ g/L; however, the text identifies the concentration as 34,000 μ g/L [FSDEQP 2919, 2921, 2923].

In January 1997, a subsurface soil investigation was conducted at the former Allen's Cleaners. Soil borings BB-1 and BB-2 were located inside the building near the former sumps, and boring BB-3 was located near the northwest corner of the building. Soil samples were collected at depths ranging from 7 to 25 feet bgs. Laboratory analysis did not detect VOC concentrations at or above the MDL in any of the collected soil samples. Soil gas samples were collected for laboratory analysis at depths of 7 and 20 feet bgs. Laboratory analysis identified the presence of PCE in all of the soil gas borings. The maximum concentration of PCE detected (33 μ g/L) was in the soil gas sample collected at 7 feet bgs in boring BB-3 [FSDEQP 2683-2684].¹²

¹¹ The non-residential SRL is 13 mg/kg for PCE, 65 mg/kg for TCE, and 1,200 mg/kg for 1,1,1-TCA [GDDEQW 27-28].

¹² Analytical data for all samples and depicted locations of the wells were not provided in the source document.

Ms. Vargas March 10, 2014 Page 13 of 18

In April 1997, three groundwater monitoring wells (AMW4, AMW5, AMW6) were installed along the western portion of the former Allen's Cleaners property. In August 1997 a fourth well (AMW7) was installed in the same location. AMW4 was drilled to a depth of 100 feet bgs and screened at 80 to 100 feet bgs. AMW5 through AMW7 were drilled to a depth of approximately 60 feet bgs and screened at 30 to 50 feet bgs. During drilling activities, in situ groundwater samples were taken at various depths between 35 and 98 feet bgs. Samples from AMW4 were collected at 55, 60, 75, 80, 90, and 98 feet bgs. Samples from AMW5 were collected at 40 and 55 feet bgs. Samples from AMW6 were collected at 35, 45, 50, and 60 feet bgs. Samples from AMW7 were collected at 37 feet bgs. Laboratory analysis detected concentrations of dissolved-phase PCE above the AWQS limit of 5 μ g/L in the in situ groundwater samples collected from boring AMW4 at 55 feet bgs (7.6 μ g/L), 90 feet bgs (13 μ g/L), and 98 feet bgs (7.1 μ g/L); from boring AMW5 at 40 feet bgs (120 μ g/L); and from boring AMW6 at 35 feet bgs (23 μ g/L) [FSDEQP 2684].¹³

Under a separate investigation in May 1997, two soil borings, HP-AC1 and HP-AC2, were drilled downgradient (to the west) of the former Allen's Cleaners. Boring HP-AC1 was drilled to a depth of 124 bgs. Boring HP-AC2 was drilled to a depth of 112 feet bgs. No soil samples were collected for boring HP-AC1, but in situ groundwater samples were collected at the following depths: 33, 48, 63, 78, 105, and 120 feet bgs. Dissolved-phase PCE was detected above the AWQS limit of 5.0 μ g/L in groundwater samples collected at 33 feet bgs (44.5 μ g/L) and 48 feet bgs (316 μ g/L). Laboratory analysis of groundwater samples collected at depths greater than 48 feet bgs did not contain concentrations of dissolved-phase PCE above the MDL (1.0 μ g/L). For boring HP-AC2, one soil sample was collected at 70 feet bgs and no PCE was detected. In situ groundwater samples were collected from boring HP-AC2 at the following depths: 30, 45, 75, 90, and 105 feet bgs. Dissolved-phase PCE was detected at levels exceeding the AWQS limit of 5.0 μ g/L in the groundwater sample collected at 45 feet bgs (43.2 μ g/L) FSDEQP 2684-2685].¹⁴

In December 2003, three SVE and six AS wells were installed at the former Allen's Cleaners. An SVE/AS system was installed and started in November 2004. As of July 8, 2005, the SVE/AS system had removed approximately 33 pounds of PCE and was then decommissioned on that date [FSDEQP 2686].

An August 2007 fluid level monitoring report, prepared by SECOR International Inc., provides a summary of groundwater sampling results from 1992 to 2007 for selected VOCs, including PCE and TCE, detected in monitoring wells AMW1 through AMW8 near the former Allen's Cleaners facility.¹⁵ Table 4 below highlights the PCE and TCE results above AWQS limits. Note that no results exceeding AWQS limits were recorded from well AMW3 and AMW4 [FSDEQP 2662-2666].

¹³ The location of the wells was not provided in the source document.

¹⁴ Analytical data for all samples and depicted locations of the wells was not provided in the source document.

¹⁵ AMW8 appears to have been installed in 2003 as the first sampling event noted is June 13, 2003. The well is located approximately 350 feet southwest of the former Allen's Cleaners property on the west side of 40th Street [FSDEQP 2666, 2670].

OWNERSHIP HISTORY

Kachina Cleaners

Kachina Cleaners has operated on Parcel 170-32-099D at 3926 East Indian School Road from 1959 to present. This parcel is currently owned by Constantine and Stella Tsantilas, as trustees of the Constantine and Stella Tsantilas Revocable Trust, and comprises approximately 12,060 square feet [FSMCTA 1-2]. Table 5 below lists the owners of Parcel 170-32-099D during the time PCE was used on the property. The complete conveyances for this parcel are shown in the title tree enclosed as Figure 4 (Enclosure 5).

List of Owners for Farcel 170-32-099D		
Owner	Date	
James and Bessie Tsantilas	1955-1973	
Bessie Tsantilas	1973-1988	
Constantine and Stella Tsantilas	1973-1999	

1999-Present

Constantine and Stella Tsantilas Revocable Trust

Table 5List of Owners for Parcel 170-32-099D

Parcel 170-32-099D was purchased by the Tsantilas family in 1955 as vacant land [FSDEQP 2782].¹⁶ PCE use at the property is assumed to have started in 1959 when dry cleaning operations began. Kachina Cleaners is currently operating on the site and is believed to still use PCE, though it is only used in the dry cleaning machines and not stored on site [FSDEQP 2351-2375, 2782; FSFDPX 35].

Allen's Cleaners

Allen's Cleaners operated on Parcel 171-26-061G at 4129 North 40th Street from 1969 to 1989.¹⁷ The current parcel owner is Verde SPE I, LLC, a Delaware corporation. Table 6 below lists the owners for Parcel 171-26-061G during the time PCE was used on the property. The complete conveyances for this parcel are shown in the title tree enclosed as Figure 5 (Enclosure 6).

Owner	Date
Herbert and Norma Potthoff	1958-1977
Harris Trust Company and Rose Morgan, Co-trustees	1977-1984
of the Herbert Potthoff Revocable Trust	
Palm Grove Redevelopers	1984-1999

Table 6List of Owners for Parcel 171-26-061G

Allen's Cleaners operated on Parcel 171-26-061G from 1969 to 1989. Allen's Cleaners used PCE dry cleaning solvent during its operations; however, the exact period of use is not documented, though it is assumed that the company used PCE throughout its entire period of operations [FSDEQP 2678].

¹⁶ The source document, a 1996 site characterization report prepared by Earth Tech, states that the Tsantilas family purchased the property in 1953; however, a warranty deed for the property was not signed until 1955 by James and Bessie Tsantilas [FSDEQP 2782; FSNETR 35-36]. HGL will use the deed document date as the date of ownership.

¹⁷ Parcel 171-26-061G was created in 2007 when Parcels 171-26-061E and 171-26-061F were merged.

CONCLUSION

Results of industrial survey and site investigation research for the ECP 40th Street and Indian School WQARF site provide evidence of the presence and possible release of PCE at the WQARF site due to dry cleaning operations at the facilities described in Table 7.

Table 7
Dry Cleaners at ECP 40 th Street and Indian School WQARF Site

Facility Name	Address	Operational Period
Kachina Cleaners	3926 East Indian School Road	1959–Present
Allen's Cleaners	4129 North 40 th Street	1969–1989

Kachina Cleaners began operating at 3926 East Indian School Road in 1959 and is currently operating at that location. Kachina Cleaners reportedly used approximately 40 to 50 gallons of PCE each week during its operations.¹⁸ The waste PCE was collected and taken to off-site facilities for disposal. Wastewater from dry cleaning operations was filtered and discharged into the sewer system as of the 1960s. Prior to that two cesspools and a septic tank were used at the facility [FSDEQP 2782]. An October 1988 draft Phase I report identified Kachina Cleaners as a high potential source of chemical contamination for SRP well 17.9E-7.5N because of the company's proximity to the well and its documented use of PCE. This SRP well had the highest level of PCE contamination in the ECP WQARF study area [FSDEQP 2396, 2450-2451]. Several sampling events have occurred at Kachina Cleaners and have identified elevated levels of PCE in the soil and groundwater. PCE was found as high as 540 μ g/L in a 1997 groundwater sampling event, as high as 460 μ g/L in a 1996 soil vapor sampling event, and as high as 5.6 μ g/kg (0.0056 mg/kg) in a 1996 soil sampling event [FSDEQP 2667, 2781, 2788].¹⁹

Allen's Cleaners operated at 4129 North 40th Street from 1969 to 1989. Allen's Cleaners used PCE as its primary dry cleaning solvent. PCE was initially detected in soil gas during an October 1989 soil gas survey. PCE was detected at 370 μ g/L at a depth of 15.2 feet bgs [TIDEQP 1305-1306, 1311-1312]. In 1993, two sumps at the former Allen's Cleaners were removed, and PCE was found in soil samples taken from the excavation. A sludge sample taken from one of the sumps at Allen's Cleaners has a PCE concentration of 977.9 mg/kg [FSDEQP 2682-2683, 2724]. Elevated levels of PCE and TCE were found in groundwater samples collected both downgradient and cross-gradient from the facility on December 16, 1994. Monitoring well AMW1, located 50 feet downgradient of the facility, had the highest concentration of PCE at 37,000 μ g/L (1998) and the highest concentration of TCE at 490 μ g/L (1994) [FSDEQP 2662, 2919, 2923].²⁰ In December 2003, SVE and AS wells were installed at the former Allen's Cleaners and were operational until July 8, 2005 [FSDEQP 2686].

¹⁸ The exact time period for which this volume of PCE use applies is unclear.

¹⁹ The highest detection of PCE reported near Kachina Cleaners was 800 μ g/L, but that detection occurred in an in situ sample collected during a 1997 hydropunch investigation [FSDEQP 2680-2681].

²⁰ The TCE detection came from a duplicate sample taken at AMW1 [FSDEQP 2919, 2923]. These concentrations exceed the AWQS limits of 5.0 μ g/L for both PCE and TCE [FSDEQP 2668].

Notes:

PCE = Tetrachloroethene

TCE = Trichloroethene

cis-1,2-DCE = cis-1,2-Dichloroethene

VOCs = Volatile organic compounds

 μ g/L = Micrograms per liter

ppmV = parts per million by volume (or volumetric)

NA = Not analyzed or not available.

(d) = Duplicate sample.

(1) = Sample dilution required.

(2) = Sample results reported as ppmV on laboratory report.

Notes:

Well ID = Well identification.

ADWR = Arizona Department of Water Resources

PCE = Tetrachloroethene

TCE = Trichloroethene

1,1,1-TCA = 1,1,1-Trichloroethane

VOCs = Volatile organic compounds

MTBE = Methyl tert-butyl ether

ADEQ = Arizona Department of Environmental Quality

NA = Not analyzed; or not available; or not applicable, as appropriate

NE = Aquifer Water Quality Standard not established

ND = Concentration reported as non-detect; detection limit unknown

BOLD = Laboratory results exceed AWQS

(1) Sample depth is approximate feet below the measured water table surface. Term "NA" indicates that sample was collected from submersible pump inlet.

(2) = Duplicate sample

(3) Indicated m- and p-xylenes

(4) Samples collected following well installation

ASRACHEest Centrel PhoenixM0th St & Indian School (20419 and 20426)4.1 Work Plans/RI Work Plan Tables/120707 RI Work Plan Tables/Indi.eds

(5) Well was not sampled due to insufficient water in water column in well casing

(6) Historical tabulated data for ARCO well MW5 was focused on gasoline constituents; PCE and TCE may have been found, but they were not tabulated on ARCO const.

DTW = Measured depth to water

mS/cm = MilliSiemens per centimeter

D.O. = Dissolved oxygen

mg/L = Milligrams per liter

Cond. = Conductivity

NM = Not measured

GW Elev. = Calculated groundwater elevation

Notes:

Well ID = Well identification

ADWR = Arizona Department of Water Resources ADEQ = Arizona Department of Environmental Quality

Screen Int. = Well screen interval

bsg = Below surface grade

MPE = Measuring point elevation

amsi = Above mean sea level

Depth to water measurements from 1992 thru 1998 from Fluor Daniel GTI, Inc. (FD GTI) Groundwater Sampling Report, 1st Quarter 1998, East Central Phoenix WQARF Project Area, dated 3/26/98 (except where noted).

 Field parameters collected on date well was sampled and tabulated for uppermost sample when sampling at multiple intervals.
 Hydro Geo Chem, Inc. Results of Groundwater Investigation, Former Allen's Cleaners Facility, dated 2/17/98. FD GTI calculated groundwater elevations at AMW1 and AMW2 corrected to most recent MPE.

(3) FD GTI measured DTW suspect; measurements indicated have been adjusted by SECOR based on available data.

(4) On 3/21/02, a blockage was measured at ~34.7 feet below MPE. On 4/24/02, air injection was utilized to clear the well to ~42 feet bsg.

(5) On 3/21/02, a blockage was measured at ~31.2 feet below MPE. On 4/24/02, air injection was utilized to clear the well to 50 feet bsg.

(6) On 3/21/02, a blockage was measured at ~26.6 feet below MPE. On 4/24/02, air injection was utilized to clear the well to ~47 feet bsg.

(7) On 4/24/02, a 2-inch diameter well was installed inside the existing 4-inch diameter well due to a suspected casing break.

(8) Depth to water measurements from ARCO wells collected by Delta Environmental Consultants, inc. through 1998.

(9) Former ARCO 5282 was undergoing demolition during the sampling event.

(10) MW5 at former ARCO 5282 was dry.

(11) Insufficient water, less than 2 feet of water in well. No PDBS hung.

(12) Well gauging information from installation.

(13) Unable to open well cover.

(14) Wells were gauged to examine the influence of pumping the SRP well located at 32nd Street and Indian School Road.

#### **EXECUTIVE SUMMARY**

The East Central Phoenix (ECP) Water Quality Assurance Revolving Fund (WQARF) Site – 40th and Indian School Road (the Site) is the areal projection of two sources of dry cleaning chemicals that have contaminated groundwater in the area of 40th Street and Indian School Road in Phoenix, Arizona. The Site is approximately bounded by Devonshire Avenue to the north, 40th Street to the east, East Piccadilly Road to the south, and 38th Place to the west (Figure F-1). The sources of the dry cleaning chemicals are Kachina Cleaners located at 3926 East Indian School Road and the former Allen's Cleaners which was located at 4129 North 40th Street. The contaminant of concern (COC) for the Site is tetrachloroethene (PCE).

The land and water use study (use study) is required in accordance with Arizona Administrative Code (A.A.C.) R18-16-406(A)(3), which states that the remedial investigation (RI) shall identify current and reasonably foreseeable uses of land and waters of the state. As specified in A.A.C. R18-16-406(D), reasonably foreseeable uses of water are those likely to occur within 100 years.

In order to obtain consistent land and water use information from specified stakeholders, a standardized land and water use study questionnaire was prepared and mailed by ADEQ and ADEQ's consultant Hargis + Associates, Inc. (H+A) to Maricopa County (the County), municipalities, and utilities in the Site area. Questionnaires were completed and returned to ADEQ/H+A, by the City of Phoenix (COP), the County, and Salt River Project (SRP). The questionnaires requested specific information in the following areas:

- Property information
- On-site wells
- Water use
- Waste streams

Based on the land and water use study questionnaires and the answers returned to ADEQ, very limited, if any significant change to respondent properties would be expected to occur.

The entire Site is located within the COP. Arizona State law requires each city to have a General Plan that establishes policy for the city's physical development (Arizona Revised Statutes [A.R.S.] 9-461.05). The COP General Plan includes goals, policies, and recommendations to guide land use and neighborhood development for the next 10 to 20 years and beyond. Thus, most of the discussion of land use centers on the COP General Plan, most recently amended in January 2013.

The COP is comprised of 15 "urban villages". The Site is located in the Camelback East Village (CEV). CEV has two primary cores: the 24th Street and Camelback Road core and the 44th Street and Van Buren Street core. The primary land use within the CEV and the Site is single family residential followed by multiple family residential and commercial.

The COP Water Services Department issued a water resources plan (Plan) in 2011. The plan includes water development and water use policies. Plans for specific groundwater development within the ECP Site are not addressed in the Plan.

Since 1985, groundwater use by the COP steadily declined due to the availability of Central Arizona Project (CAP) water, the development of SRP-based surface water supplies, and provisions in the State's Water Code (1919), updated by A.R.S. 9-461.05, which mandates groundwater use limitations. In effect, the Water Code and COP corresponding policy rely on groundwater as an essential supply to mitigate future water shortages. The COP currently meets over 95 percent of its demand with surface water sources. The COP also relies on groundwater to accommodate water system maintenance and as a back-up during temporary outages. The City has the current capability of producing 28 million gallons per day (mgd) (15-20,000 acre-feet) per year, and typically withdraws between 6,000 and 9,000 acre-feet per year. Sufficient wells exist to produce more than 28 mgd, though rehabilitation and/or treatment may be needed to increase the yield due to aquifer contamination and aging well conditions.

In 2010, the Arizona Department of Water Resources (ADWR) approved the COP's application for a designation of assured water supply. This designation, reconfirmed the original approval by ADWR in 1998, and confirms the COP has sufficient water supplies to support existing customers and projected growth demands through the year 2025 for at least 100 years. The COP concludes in their Water Resources Plan that sustainable water supplies exist for all growth currently anticipated through 2060 under normal supply (non-shortage) conditions (COP, 2011).

iv

Degraded groundwater constitutes a vast reserve of water for use in meeting the COP's future water needs. The COP maintains several wells within or adjacent to WQARF sites for emergency use and future use in meeting service area water needs; these wells could be placed back in service with the addition of wellhead treatment systems or approved blending programs. Also, the COP holds "Special Pump Rights" with SRP, which are rights to groundwater well capacity developed by SRP. The COP does not have any wells within one mile of the Site contaminant plumes.

SRP generally uses groundwater to supplement its surface water supply. Thus, annual use of groundwater fluctuates depending upon the availability of surface water. SRP currently has four groundwater supply wells within one mile of the within the ECP WQARF area. As the area becomes more urbanized, wells with suitable water quality may be shifted to municipal use. SRP indicated in their Land and Water Use Questionnaire response that all its properties within the vicinity of the ECP WQARF Area will remain in use over the next 100 years. Additionally, SRP anticipates its groundwater supply wells in the ECP WQARF Area will transition from irrigation to municipal service (potable supply) in the reasonably foreseeable future.

v

#### **1.0 INTRODUCTION**

The Arizona Department of Environmental Quality (ADEQ) has prepared this Land and Water Use Report for the East Central Phoenix (ECP) 40th and Indian School Site Water Quality Assurance Revolving Fund (WQARF) Site (the Site) to meet the requirements established under Arizona Administrative Code (A.A.C.) R18-16-406(D). The purpose of the report is to gather information regarding current and foreseeable uses of land or waters that have been or are threatened to be impacted by a contaminant release.

#### 1.1 PROCESS OVERVIEW

The process to complete the remedial investigation (RI) and select remedial objectives (ROs) begins with the completion of the Draft RI Report. Following the completion of the Draft RI Report, which includes the Land and Water Use Report, a public meeting is held to discuss the reports and solicit input for the selection of ROs. Typically, the public will be given 30 to 60 days to comment on the reports. Following the public meeting and comment period, ADEQ issues the Proposed RO Report. The ROs chosen for a site may be based on none, some, or all of the uses identified in the Land and Water Use Report. If there is significant public interest or additional information has been discovered, an additional public meeting to discuss the ROs is held. The Final RO Report is then prepared and included in the Final RI Report.

#### 1.2 LAND AND WATER USE REPORT

The purpose of the Land and Water Use Report is to gather information regarding current and "foreseeable" uses of land or waters that have been or are threatened to be impacted by a contaminant release, and to project time frames for future changes in those uses. Information gathered from discussions with property owners, water providers, municipalities, and well owners are to be included in the report.

In general, this Land and Water Use Report identifies various current and potential future uses of land and water in the vicinity of the Site. However, the report does not evaluate the uses, nor does it classify the use as "reasonably foreseeable". The evaluation of uses will take place during public comment periods, and public meetings and will be presented in the Proposed RO Report.

1

#### **1.3 SITE BACKGROUND**

The Site is generally bounded by Devonshire Avenue to the north, 40th Street to the east, East Piccadilly Road to the south, and 38th Place to the west as shown on Figure F-1. The 40th and Indian School Road Site was placed on the WQARF Registry List in 1998. The current contaminant of concern (COC) at the site is PCE. Kachina Cleaners and the former Allen's Cleaners facility have been investigated with regard to potential PCE contamination and identified as sources.

#### Kachina Cleaners

Kachina Cleaners began operating at 3926 East Indian School Road in 1959 and is currently operating at that location. Prior to the early 1960s, and before being connected to the sewer system, Kachina Cleaners used two cesspools and a septic tank for wastewater disposal. They were located northwest of the main building. In addition, a lint trap was located just south of the septic tank (HydroGeoLogic [HGL], 2014).

In the early 1960s, wastewater from Kachina Cleaners, containing PCE, passed through filters prior to being discharged to the sewer system. The spent filters were removed and disposed of by Safety-Kleen Corporation. Waste PCE fluids were distilled for recycling, and leftover amounts of PCE were handled and disposed of by Rinchem Company, Inc. Kachina Cleaners reportedly used 40 to 50 gallons of PCE per week (HGL, 2014). According to the 1996 site characterization report prepared by Earth Tech, Inc., the cesspools and septic tank were reportedly no longer in use in 1996, but were still present (HGL, 2014).

As of 2014, Kachina Cleaners is still operating at 3926 East Indian School Road, and City of Phoenix Fire Department records indicate proper chemical storage and apparent use and no violations in recent evaluations. The Kachina Cleaners Maricopa County Air Quality Department permit is current and planned for renewal in January 2016 (HGL, 2014).

#### Former Allen's Cleaners

Allen's Cleaners operated at 4129 North 40th Street from 1969 to 1989. Allen's Cleaners used PCE as its primary dry cleaning solvent; however, waste disposal at the facility was not documented until 1987, when Safety-Kleen was retained to transport and dispose of dry cleaning waste products (HGL, 2014). In 1993, a site assessment was conducted and an underground vault was located in the northeast corner of the laundry just inside the rear doors. No fluid connection was observed between the vault and the sewer and access drains to this line were capped. The vault and plumbing were removed, broken down, and placed in drums by Gulf-Pacific in November 1993.

2

The excavated materials only appeared to provide evidence of a potential release at the vault at low quantities; not supportive of the wide area contamination reported in previous studies.

PCE was initially detected in soil gas during an October 1989 soil gas survey at the site, where PCE was detected at 370  $\mu$ g/L at a depth of 15.2 feet bgs. In 1993, two sumps at the former Allen's Cleaners were removed, and PCE was found in soil samples taken from the excavation. A sludge sample taken from one of the sumps at Allen's Cleaners has a PCE concentration of 977.9 mg/kg (HGL, 2014).

Elevated levels of PCE and TCE were found in groundwater samples collected both downgradient and cross-gradient from the facility on December 16, 1994. Monitoring well AMW-01, located 50 feet downgradient of the facility, had the highest concentration of PCE at 37,000 micrograms per liter ( $\mu$ g/L) in 1998 and the highest concentration of TCE at 490  $\mu$ g/L in 1994 (HGL, 2014).

Groundwater sampling in 2002, by ADEQ, showed the continued presence of PCE above the 5 µg/L Arizona Aquifer Water Quality Standard (AWQS) limit at the Site. In 2003, ADEQ installed a groundwater monitoring well in the alley between the former Allen's Cleaners and Kachina Cleaners, as well as three (3) soil vapor extraction (SVE) wells and six (6) air sparge (AS) wells at the former Allen's Cleaners as part of an early response action (ERA). In 2005, the SVE/AS system was decommissioned and removed from the former Allen's Cleaners after removing approximately 33 pounds of PCE from the vadose zone throughout its operation from 2004 to 2005.

In 2007, ADEQ sent out notices per Arizona Revised Statutes § 49-287.03, initiating the Remedial Investigation for the Site. Several phases of investigation have been conducted including soil and soil vapor sample collection, and groundwater monitoring well installation and sampling. The results of these investigations have indicated that volatile organic compounds (VOCs), primarily PCE, are present in soil, soil vapor, and groundwater in the vicinity of the Site.

The aquifer underlying the site is known as the Upper Alluvial Unit (UAU) Aquifer. The UAU extends to depths of approximately 400 feet below land surface (bls) in the surrounding area (Brown and Pool, 1989). It consists of basin fill sediments of sand and gravel proximal to the Salt and Gila Rivers and at the basin margins. In areas distal to the basin margins, which include the Site, the UAU is silt and sand and is significantly less thick. Typically, the UAU is considered an unconfined aquifer. Shallow groundwater beneath the Site and surrounding vicinity has historically flowed southwest and has a small gradient under non-pumping conditions.

3

#### **1.4 GENERAL GROUNDWATER QUALITY**

Groundwater in the Site and the surrounding area generally contain concentrations of total dissolved solids (TDS) ranging from 500 milligrams per liter (mg/L) to slightly greater than 1,000 mg/L (Brown and Pool, 1989) (Thiros, S.A. et. al., 2010). The EPA has not set a maximum contaminant level (MCL) for TDS, however, there is a secondary standard of 500 mg/L TDS for drinking water. The secondary standards are non-enforceable guidelines regulating contaminants that may cause aesthetic effects in drinking water. The principal ions present within local groundwater include chloride, magnesium, sodium, and calcium (Reeter and Remick, 1986).

SRP provided the following water quality information on their questionnaire (Appendix A) from their wells located within the ECP WQARF Site, all of which show impacts:

SRP Well No.	ADWR 55 Registration	Intersection/ Local Area	Maximum PCE Concentration (µg/L)	Maximum TCE Concentration (µg/L)
17E-8N	55-608431	32nd/Indian School	82	1.5
17.1E-7.4N	55-607731	32nd/Osborn	5.8	ND
17.9E-7.5N	55-617857	40th/Osborn	210	9.9
18E-8.8N	55-617825	40th/Coolidge	1.1	ND

Note:

- 1. Bolded value indicates concentration detected above Aquifer Water Quality Standard.
- 2. Data obtained from SRP via questionnaire (See Appendix A).
- 3. ND not detected.

As mentioned above, PCE is the COC that has been detected in groundwater samples collected from the Site wells at concentrations greater than the AWQS of 5  $\mu$ g/L. PCE groundwater concentrations have dropped significantly since startup of the ERA with PCE only exceeding the AWQS at wells AMW-08 at 20  $\mu$ g/L [49.6 feet bgs] and at well KMW-01 at 5.4  $\mu$ g/L [50.5 feet bgs] during May 2014. The decline in COC concentrations at the Site is attributed to the ERA.

## 2.0 USE EVALUATION

The following sections outline current and foreseeable land and water uses for the Site and the surrounding area. Reasonably foreseeable uses for land are those uses of land likely to occur at the Site within a reasonable time period. Reasonably foreseeable uses of water are those likely to occur within 100 years unless a longer time period is shown to be reasonable based on site-specific circumstances [A.A.C. R18-16-406(D)].

#### 2.1 LAND AND WATER USE QUESTIONNAIRES

In order to obtain consistent land and water use information from specified stakeholders, a standardized land and water use study questionnaire was prepared and mailed by ADEQ and Hargis + Associates, Inc. (H+A) to Maricopa County, municipalities, and utilities in the Site. Questionnaires were completed and returned to ADEQ/H+A, by City of Phoenix (COP), Maricopa County, and SRP; they are included in Attachment A.

The questionnaires requested specific information in the following areas:

- Property information
- On-site wells
- Water use
- Waste streams

The information provided in the questionnaires was used in conjunction with the references identified in this section.

#### 2.2 LAND USE

The entire Site is located within the COP in Maricopa County. Arizona State law requires each city to have a General Plan that establishes policy for the city's physical development. The COP General Plan includes goals, policies, and recommendations to guide land use and neighborhood development for the next 10 to 20 years and beyond. Thus, most of the discussion of land use centers on the COP General Plan, most recently amended in January 2013.

# HARGIS + ASSOCIATES, INC.

As indicated on the questionnaire, Maricopa County has no specified land or water uses within the ECP Site; however, it is important that any planned remediation coordinate with Maricopa County Air Quality Department for the necessary permits (i.e. dust control, VOC emissions, etc.).

The COP is comprised of 15 "urban villages" (Figure F-2) (COP, 2002). The Site is located in the center of the Camelback East Village (CEV) (Figure F-3) which covers an area of 36.3 square miles. CEV has two primary cores: 1) the 24th Street and Camelback Road core, comprised of office and retail shops, including movie theaters, major department stores, restaurants, and hotels; and 2) the 44th Street and Van Buren Street core an area of airport and regional offices uses along with a Chinese cultural center. The area around 44th Street and Thomas Road is considered the secondary core of the village. This village offers a range of housing diversity and neighborhood types evenly split in the number of single family and multi-family residences. Areas such as the Arcadia neighborhood consist of large acre lots while higher density residential developments surround the more concentrated centers like the CEV primary core. A major portion of the housing stock was built between 1950 and 1970, but new construction of both single family and multi-family homes continues.

There are five school districts represented in the entire (CEV), three are located within the ECP WQARF Site: Scottsdale Unified School District, Phoenix Union School District, and Creighton School District. Monte Vista School (Creighton School District) and Christ Lutheran School are located in the vicinity of the 40th Street and Indian School Road Site.

Each village located within the COP has a Planning Coordinator and a Village Planning Committee who have input into planning decisions for that community and to the COP mayor and Planning Commission.

Development in the area occurs consistent with zoning laws and must go through a site-planning review and permit process. The primary land use within the Site is single family residential (38%) followed by parks/open space (26%), multiple family residential (12%) and commercial/industrial (12%), public/transportation (8%). Four (4%) percent of the land within the village is reportedly vacant (COP, 2013). Current zoning districts in the Site are identified below and are shown on Figure F-4. A more detailed description of COP zoning designations can be found in Table F-1.

6

#### 2.2.1 Current Site-Specific Land Use

Kachina Cleaners began operating at 3926 East Indian School Road in 1959 and is currently operating at that location. The current zoning designation for the Kachina Cleaners property is C-2, Commercial – Intermediate Commercial (Figure F-4) (COP, 2013).

The second source, the former Allen's Cleaners, operated at 4129 North 40th Street and was an active dry cleaning facility from 1969 until 1989. According to Maricopa County Assessor, the parcel is now listed at the address 4020 E. Indian School Road and owned by Verde SPE-I, LLC. The current occupant of the building is DriveTime Automotive Group, Inc., an automotive dealer; this location is a corporate headquarters. The current zoning designation for the former dry cleaning property is C-2, Commercial – Intermediate Commercial (Figure F-4) (COP, 2013).

#### 2.2.2 Current Regional Land Use

The current land use in and surrounding the Site is as follows (Figure F-4):

Zoning	Description
District	
C-0	Commercial Office – Restricted Commercial (CO prior to 1986)
C-0/G-0	Commercial Office – General Office Option (Minimum 1 gross acre)
C-1	Commercial – Neighborhood Retail
C-2	Commercial – Intermediate Commercial
P-1	Passenger Automobile Parking, Limited (Surface Parking)
PAD-9	Planned Area Development (No longer available for rezoning)
PUD	Planned Unit Development Individually tailored standards to create a built environment
	superior to that produced through conventional zoning and design guidelines
R-3A	Multiple Family Residence (Detached SF 5 to 6.5 or 12 w/bonus)
	(Attached 22 to 23.1 or 26.4 w/bonus)
R-3	Multiple Family Residence (Detached single family [SF] 5 to 6.5 or 12 with bonus)
	(Attached 14.5 to 15.23 or 17.4 with bonus)
R-4	Multiple Family Residence (Detached SF 5 to 6.5 or 12 w/bonus)
	(Attached 29 to 30.45 or 34.8 w/bonus)
R-5	Multiple Family Residence (Detached SF 5 to 6.5 or 12 with bonus)
	(Attached 43.5 to 45.68 or 52.5 with bonus)
R1-6	Single Family Residence (Density range of 5 to 5.5 or 6.5 with bonus)
R1-10	Single Family Residence (Density range of 3 to 3.5 or 4.5 with bonus)

# HARGIS + ASSOCIATES, INC.

Zoning	Description
District	
R1-14	One Family Residence (14,000 sq. ft. min.) (No longer available for rezoning)
R1-18	Single Family Residence (density range of 1.95 to 2.05 or 2.34 w/bonus)
RE-24	One Family Residence (24,000 sq. ft. min.) (No longer available for rezoning)
RE-35	Single Family Residence (density range of 1.1 to 1.15 or 1.32 w/ bonus)
R-O	Residential Office – Restricted Commercial

## 2.2.3 Future Land Use

The CEV Planning Coordinator and CEV Planning Committee meet regularly to accept and review requests for zoning changes within the CEV. The COP response to their questionnaire indicated there are no current foreseeable plans to alter current zoning districts in the Site vicinity. Property owners can file to change the zoning designation of their property. Requests for zoning changes must go through a public hearing and be approved by the City Council prior to finalization.

#### 2.3 GROUNDWATER USE

The Site lies within the Phoenix Active Management Area (AMA) (Figure F-5) (ADWR, 2014b). The Phoenix AMA was created by the Arizona Groundwater Management Code passed in 1980 and covers approximately 5,646 square miles in central Arizona. All groundwater withdrawn from any AMA must occur under a groundwater right or permit, unless groundwater is being withdrawn from an exempt well. An exempt well is a well with a maximum pumping capacity of 35 gallons per minute. Exempt wells may be used to withdraw groundwater only for non-irrigation purposes and are generally used for domestic purposes. All exempt wells must be registered with the ADWR. Non-exempt wells have a pumping capacity greater than 35 gallons per minute and are associated with one of the following types of rights or permits: Grandfathered rights, service area rights, and withdrawal permits.

According to ADWR records, there are seven (7) non-exempt withdrawal wells located within one-mile of the Site; all owned and operated by SRP (Table F-2) (Figure F-6) (ADWR, 2014a). ADWR records indicate that there are five (5) exempt withdrawal wells located within one-mile of the Site; all five wells have an intended use for domestic irrigation (ADWR, 2014a, and Attachment B). There are no grandfathered rights in the Site (ADWR, 2014c). The COP and SRP have service area rights in the Site, however, only SRP is currently pumping groundwater from beneath the Site.

8

Water levels in the Upper Alluvial Unit (UAU) at the Site have been monitored since April 1992. During the period of record for the Site monitor wells, the depth to water has ranged from approximately 27 feet bgs in the mid 1990's to greater than 50 feet bgs in 2014. Groundwater elevations measured in Site wells during May 2014 are depicted on Figure F-7. The direction of groundwater flow historically has been to the west-southwest at gradients ranging from approximately 0.006 to 0.007. Vertical gradients between the shallow and deeper zones of the UAU monitored at the Site are generally negligible.

#### 2.3.1 Municipality and Utility Groundwater Use

The COP and SRP pump groundwater as needed when surface water supplies cannot meet their customer needs. The following sections discuss the current and future groundwater uses of the COP and SRP.

#### 2.3.1.1 Current City of Phoenix Needs

The COP relies on four primary water supply sources: SRP, Central Arizona Project (CAP), groundwater pumped from COP wells, and reclaimed water (COP, 2011). SRP supplies water from the Salt and Verde Rivers to eligible lands within the Phoenix service areas which are generally south of the Arizona Canal. The remainder of the service area is supplied primarily by Colorado River water delivered by the CAP. Groundwater wells and reclaimed water make up the remainder of the COP water supplies. During normal supply years, approximately 50 percent of the COP water supply comes from SRP; 44 percent is from CAP; and approximately 3 percent is from groundwater pumpage and 3 percent reclaimed water each. When SRP and/or CAP water supplies are reduced, the COP supplements water supplies with groundwater pumped from COP wells (COP, 2011).

Because of groundwater quality degradation due to the presence of industrial solvents such as PCE and TCE, the COP has abandoned or discontinued use of 20 wells (COP, 2011). This has resulted in a loss of approximately 23 million gallons per day of groundwater production. The COP total loss of well production due to elevated concentrations of organic and inorganic substances exceeds 90,000 acrefeet per year, according to the Water Resources Plan (COP, 2011), as a result of the closure of more than 60 wells (60 percent of the total production capacity of all COP wells). Any of these wells, if returned to service in the future, will require cleanup of the contaminated aquifers or the installation and operation of expensive wellhead treatment systems. No COP wells exist within one mile of the Site contaminant plumes (Figure F-6).

9

#### 2.3.1.2 Future City of Phoenix Needs

According to information provided by COP, since 2002 (a peak demand year), the total water demand declined by more than 16%, although the service population of COP increased by approximately 8% (COP, 2011). The decrease in overall per-capita total water demand has been attributed to the increased efficiency in water use which declined by 25 percent between 1996 and 2011. Contributing factors in the decrease include improved plumbing fixture standards, smaller residential lots, fewer new pools, increased installation of desert landscaping in both new and existing homes, increased customer "water awareness," and higher water rates.

Regional economic conditions are a large component of the future water demands, as well as the Phoenix General Plan for land development and recent trends in residential and commercial development. Growth projections for COP reflect annual growth rates of 1.0 percent (high), 0.8 percent (base level) and 0.6 percent (low) and are assumed to top out in the 2045-2055 period based on current COP boundaries. The low projection assumes that service area growth occurs at a slow pace and that existing customers continue to become more efficient without further incentives or regulation (moderate level). The high demand line reflects fast or high-density growth and no further efficiency improvements for existing and new customers. These rates are lower than those experienced during the 1990s and early 2000's; as of Spring 2011, data indicate the actual growth rate for COP could be lower or stagnant for the next 5-10 years. The COP estimates that a "base level" consumption growth will develop at today's efficiency levels and that current customers will remain stable. Possible "moderate efficiency" consumption gains are estimated at a 10% consumption reduction for existing customers and 5% reduction for post-2010 development by 2035. "High efficiency" consumption gains are estimated at a 20% reduction in consumption for existing customers and a 10% reduction for post-2010 customers by gain by 2035. However, there are numerous factors associated with growth and consumption that cannot be fully predicted and the consequences of this possible leveling off or increasing of demand will continue to be addressed in the COP General Plan and Water Resource Plan.

Uncertainty also exists regarding water resources and the ability to meet current and future demands (COP, 2011). The following items may affect the available COP water supply:

- Cyclical drought;
- Increasing demands in the Upper Colorado River Basin States (Utah, Colorado, Wyoming and New Mexico) affecting Arizona's supply of Colorado River water;

- The availability of water supplies from the Arizona Water Banking Authority to the CAP to offset shortages;
- Climate variability on impacts on long-term flows, reservoir storage and deliveries by SRP and CAP;
- The probability of low reservoir conditions occurring in both watersheds simultaneously;
- State legal, institutional, or policy changes impacting surface water availability;
- The availability and volume of groundwater supplies without aquifer replenishment; and
- Impacts of increased groundwater pumping in the SRP watershed on river flow and reservoir storage.

If Colorado River flow should decline, allotment of CAP water for the COP and surface water supplies from SRP may be reduced if reservoir levels drop substantially and groundwater pumping cannot compensate the lack of surface water availability. As a buffer to potential surface water supply reductions, the COP has been recharging to underground storage or banking unused CAP allotments for future use (Figure F-8). However, high increases in consumption coupled with severe reductions in surface water supplies could deplete these reserves by 2020 (COP, 2011) (Figure F-9).

As part of their long-term deficit plan, COP developed a strategy to address a reasonable "worst case". These extreme conditions were modeled to represents deeper shortages than those observed in historic records. The "severe shortage" model scenario combined with the "high demand" scenario produces a maximum deficit of 165,000 acre-feet in the latter part of the 50 year planning horizon (COP, 2011).

Managing water use can be accomplished by continuing to increase efficiency of water distribution, curtailing demand, and monetary incentives, which can be addressed through infrastructure improvements, conservation programs, drought management plan, and water pricing strategies (COP, 2011). Alternate sources of water include expanded groundwater pumping, accessing water that has been stored for future use, importing water from the McMullen Valley farm, and purchasing water from other water providers (COP, 2011).

11

Besides obtaining additional surface water supplies, local groundwater is the most accessible alternate water source (COP, 2011). The COP has access to more than 3.5 million acre-feet of groundwater in the Phoenix service area over a 100 year period. Currently, the COP can produce 28 million gallons per day (mgd) (15-20,000 acre-feet) per year, but only withdraws between 6,000 and 9,000 acre-feet per year. Pumping capacity has been lost in the past two decades due to aquifer contamination and aging well conditions.

The most accessible alternate water source for COP is local groundwater; planning is ongoing for the expansion of well capacity within the service area (via well rehabilitation or the development of new service area wells). The COP plans to develop 15 additional wells at a cost of \$233 million to yield approximately 70,000 acre-feet per year; this increased yield would be allowable in any one year as long as the 100 year average usage does not exceed available groundwater and stored water credits (COP, 2011). Recent well development by the COP has occurred in northeast Phoenix area. However, as indicated in the COP questionnaire response, the COP currently has no plans to develop groundwater near or within the Site but will consider the area for well development in the future. Therefore, the potential exists for the COP to install future municipal wells within the Site or within one mile of the Site plumes.

#### 2.3.1.3 Current Salt River Project Needs

As a water supplier, SRP delivers nearly a million acre-feet of water to the Phoenix area each year. In normal runoff years, most of the water is supplied from surface water on the Salt and Verde Watersheds. However, in more dry years, more groundwater must be pumped to supplement the surface water supply. During extended periods of low run off, groundwater can account for almost one-third of the total SRP water supply. Approximately 28 percent of the average annual municipal water demand in the Phoenix AMA, from 2001-2005, was supplied by groundwater (ADWR, 2014d). Typically, groundwater comprises approximately 15% of the total water supplied by SRP to municipal treatment plants. The groundwater contribution varies seasonally with the highest contribution occurring March through August.

# HARGIS + ASSOCIATES, INC.

SRP operates and maintains seven (7) irrigation wells within approximately one-mile of the 40th Street and Indian School Road Site (Figure F-6 and Table F-2).

ADWR 55-Registry No.	SRP Well No.
55-202398	18.6E-7.6N
55-607672	17.5E-7N
55-607731	17.1E-7.4N
55-607748	19E-8.1N
55-608431	17E-8N
55-617825	18E-8.8N
55-617857	17.9E-7.5N

The last groundwater sample collected from SRP well 17E-8N in June 2011 contained PCE at a concentration of 2.2  $\mu$ g/L, and in April 2013, SRP reported PCE at a concentration of 3  $\mu$ g/L in well 17.9E-7.5N (Elliott, 2014). Groundwater quality data collected from these wells indicates that PCE concentrations in these two SRP wells are below the AWQS of 5  $\mu$ g/L, and is attributed to the Site. Groundwater pumpage at these wells has been intermittent in the recent past, but the wells can be activated at any time.

#### 2.3.1.4 Future Salt River Project Needs

Although recent use of the irrigation wells in and adjacent to the Site has been intermittent, SRP has no plans to eliminate any of these wells from their system. Based on demand analysis, SRP has indicated it will continue to need the wells in the area to remain operational, especially during dry years.

SRP anticipates all its properties in the vicinity of ECP WQARF Area will remain in use over the next 100 years. Additionally, SRP anticipates that its groundwater supply wells that are in the vicinity will transition from irrigation to municipal service (potable supply) within this time period.

Water shortage is an issue that can impact this Site and all of metropolitan Phoenix. As water quality issues compound the demand concerns already present with regard to anticipated climate change and already stressed water supplies. Water quality is a significant issue, as discussed above SRP expects its groundwater supply wells in the Site area will transition to potable supply in the future. The importance of groundwater and the ability to utilize the aquifer in local and large scale water management scenarios is critical to the future growth and wellbeing of the entire Phoenix metro-area.

# HARGIS + ASSOCIATES, INC.

According to the questionnaire response, SRP does not plan on installing any new wells in the Site; however, this could change pending COP water needs.

#### 2.3.2 Private Groundwater Use

As discussed above, five (5) exempt wells are located within one-mile of the Site; all five wells have an intended use for domestic irrigation (ADWR, 2014a, and Attachment B). There is no documented private drinking use of groundwater within the Site (ADWR, 2014a).

#### 2.4 Surface Water Use

The nearest surface water body is the Arizona Canal, located approximately 1.25 miles to the northeast of the Site. The Site area is situated within an active flood irrigation district of SRP, which receives water from the Arizona Canal from SRP lateral canal 6.1 (Salt River Valley Water Users' Association, 1980). The water is used for residential irrigation (Figure F-10). SRP lateral 6.1 in the Site area receives water from the Arizona Canal, SRP well 17.9E-7.5N, and SRP 17E-8N. Water from the lateral canal is used for irrigation and also discharges into the Grand Canal. Grand Canal, also used for irrigation, is located approximately two (2) miles southwest of the Site. Future plans for the Grand Canal include a drinking water treatment plant that may be constructed at the end of the Grand Canal. The construction of the treatment plant would change the end use of the canal water requiring that water discharged to the canal meet stricter water quality criteria than what is currently required.

#### 3.0 SUMMARY OF USES

The land and water uses described in Section 2.0 that are most likely to be relevant to the discussion of remedial objectives are presented below.

#### 3.1 LAND USE

The zoning pattern in the area has been long established and there are no foreseeable changes for the future. Land uses for the Site are expected to remain predominantly residential and commercial.

#### 3.2 GROUNDWATER USE

Current and future groundwater uses within the Site include the following:

- The COP anticipates the possible need for additional wells in and adjacent to the Site sometime in the future.
- The SRP owns six wells in and adjacent to the Site and will continue to need the wells to be operational to supplement surface water supplies. SRP has indicated that they may change water usage from irrigation to drinking water within the foreseeable future.

#### 3.3 SURFACE WATER USE

Currently, surface water uses within the Site are only for residential irrigation.

Re: Land and Water Use Study Questionnaire, East Central Phoenix - 38th Street and Indian School Road Water Quality Assurance Revolving Fund (WQARF) Registry Site, Phoenix, Arizona.

The Arizona Department of Environmental Quality (ADEQ) has prepared a Land and Water Use Study Questionnaire for specified stakeholders located in and near the East Central Phoenix - 38th Street and Indian School Road WQARF Registry site (Site). The Site is currently undergoing evaluation for remedial actions to address tetrachloroethene (PCE) in the groundwater.

This land and water use study is an important tool for ADEQ in development of the remedial objectives for this site. Please complete the enclosed questionnaire within <u>30 days</u> of receipt. The information you provide is very important for continuation of the remedial process. Please return the questionnaire in the enclosed, self-addressed, stamped envelope to Mel Bunkers, Arizona Department of Environmental Quality, 1110 West Washington St., Phoenix, Arizona, 85007.

Please contact me at 602-771-4556 or Bunkers.Mel@azdeq.gov with questions or comments.

Sincerely,

mel Bunkers

# LAND AND WATER USE STUDY QUESTIONNAIRE FOR MUNICIPALITIES/UTILITIES WITHIN THE EAST CENTRAL PHOENIX (38TH/40TH AND INDIAN SCHOOL ROAD) WQARF REGISTRY SITE

Please answer all questions. Mark "NA" for questions that are not applicable. Mark "UNK" if the answer is unknown to you at the time of completion. Please attach any additional pages as needed.

Water user municipal	ity/utility name:	City of Phoenix
Date Questionnaire w	as completed:	May 2, 2014
Name of person comp	bleting Questionnaire:	Philip McNeely /Gary Gin /Xandon Keating
Contact Name:	Philip McNeely	
Title:	Environmental Programs Ma	nager
Division:	Office of Environmental Prog	grams / Water Services Dept
Address:	200 W. Washington St. / 14th	Floor
	Phoenix, AZ 85003	
Phone Number:	602-256-5654	

1. What is the current use of your municipality's/utility's property within the limits of the East Central Phoenix (38th and Indian School Road) WQARF site? (Boundaries are approximately Indian School Road to the North, 38th Street to the east, Piccadilly Road to the South and 36th Street to the West).

Single family residential, retail, commercial, restaurants

2. Please list the municipality's/utility's properties of concern/boundaries (neighborhood planning committees, zoning, canals, wells) within the East Central Phoenix (38th and Indian School Road) WQARF site boundary.

Camelback East Village Planning Committee

3. What are the foreseeable plans for the municipality's/utility's property within the East Central Phoenix (38th and Indian School Road) WQARF site boundary as far into the future as they are known and up to 100 years, if possible.

Same as current.

4. Does the municipality/utility have a published general plan for the property within the East Central Phoenix (38th and Indian School Road) WQARF site boundary?

Yes.

5. Are parcel, zoning, or land maps available through the municipality/utility? Where are they located?

Yes. Phoenix.gov/planning

6. Please list any specific neighborhood concern the municipality/utility is aware of within the East Central Phoenix (38th and Indian School Road) WQARF site boundaries? Please list future concerns (e.g.- freeway expansion, water use, water availability, etc.)

None.

7. Please list any future zoning plans or area plans for the municipality/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary:

Same as current.

8. Please list any "special projects" projected or anticipated within the East Central Phoenix (38th and Indian School Road) WQARF site boundaries:

No.

9. If any property is leased (the municipality/utility is the lessor), how long is the lease term?

N/A

10. If the property is leased, are there plans to renew the lease and is so, for how long?

N/A

11. Please list any environmental spill of material or waste products that has occurred within the municipality/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary in the past 5 years?

Aware of none.

12 Is the municipality/utility currently sampling groundwater wells within the East Central Phoenix (38th and Indian School Road) WQARF site? If so, how often is the sampling conducted? Are analytical results being submitted to ADEQ for the groundwater database?

No sampling conducted.

13. Does your municipality/utility have an environmental manager or do you outsource environmental management to an environmental consulting firm? If so, please provide the following information:

Name:	Philip McNeely
Contact:	Office of Environmental Programs
Title:	Environmental Programs Manager
Address:	200 W. Washington St., 14th Floor
	Phoenix, AZ 85003
Phone:	602-256-5654

14. Please indicate anticipated groundwater development by the municipality/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary.

No plans at this time.

15. Are there any groundwater wells owned by the water provider that have been affected by the East Central Phoenix (38th and Indian School Road) WQARF site? If so, please list the ADWR well identification numbers. What is the current status of these wells (e.g.- shut down, still pumping)?

No.

16. What is the future use (up to 100 years) for any wells that have been impacted by the East Central Phoenix (38th and Indian School Road) WQARF site?

N/A

Thank you for your time. The Project Manager, Mel Bunkers, or a representative from ADEQ's consultant, Hargis + Associates, Inc., may follow-up on answers provided.

# LAND AND WATER USE STUDY QUESTIONNAIRE FOR MUNICIPALITIES/UTILITIES WITHIN THE EAST CENTRAL PHOENIX (38TH/40TH AND INDIAN SCHOOL ROAD) WQARF REGISTRY SITE

Please answer all questions. Mark "NA" for questions that are not applicable. Mark "UNK" if the answer is unknown to you at the time of completion. Please attach any additional pages as needed.

Water user municipal	ity/utility name: Salt River Project
Date Questionnaire w	as completed: June 6, 2014
Name of person comp	oleting Questionnaire:Andrea Martinez
Contact Name:	Andrea Martinez
Title:	Senior Environmental Engineer
Division:	Environmental Compliance
Address:	PAB 352, P. O. Box 52025
	Phoenix AZ 85233
Phone Number:	602-236-2618

1. What is the current use of your municipality's/utility's property within the limits of the East Central Phoenix (38th and Indian School Road) WQARF site? (Boundaries are approximately Indian School Road to the North, 38th Street to the east, Picadilly Road to the South and 36th Street to the West).

SRP owns and operates conveyance structures in the subject area that produce and convey water for its shareholders. Power distribution lines are also within ECP boundaries. Additionally, SRP has multiple groundwater supply wells in close proximity to the site.

2. Please list the municipality's/utility's properties of concern/boundaries (neighborhood planning committees, zoning, canals, wells) within the East Central Phoenix (38th and Indian School Road) WQARF site boundary.

SRP owns four groundwater supply wells within one-mile of the East Central Phoenix (ECP) WQARF area – 17E-8N to the west, 17.1E-7.4N to the southwest, 17.9E-7.5N to the southeast, 18E -8.8N to the northeast. SRP's wells supplement surface water supplies and are critical in times of drought. See question #15 for contamination concerns.

3. What are the foreseeable plans for the municipality's/utility's property within the East Central Phoenix (38th and Indian School Road) WQARF site boundary as far into the future as they are known and up to 100 years, if possible.

SRP anticipates all its properties in the vicinity of ECP WQARF Area will remain in use over the next 100 years. Additionally, SRP anticipates that its groundwater supply wells that are in the vicinity (see question #2 above) will transition from irrigation to municipal service (potable supply) within this time period.

4. Does the municipality/utility have a published general plan for the property within the East Central Phoenix (38th and Indian School Road) WQARF site boundary?

No

5. Are parcel, zoning, or land maps available through the municipality/utility? Where are they located?

Not available

6. Please list any specific neighborhood concern the municipality/utility is aware of within the East Central Phoenix (38th and Indian School Road) WQARF site boundaries? Please list future concerns (e.g.- freeway expansion, water use, water availability, etc.)

Water shortage is an issue that can impact this neighborhood as it can all of metropolitan Phoenix. As water quality issues will impact water supplies as much as water quantity, SRP has a specific concern regarding water quality impacts associated with the East Central Phoenix WQARF site. SRP expects the groundwater supply wells noted in #2 above will transition to potable supply in the future so the chemical quality of the groundwater is a significant issue. Our concern is heightened because of anticipated climate change and the additional stress expected to be applied to already stressed surface water supplies. The importance of groundwater and the ability to utilize the aquifer in local and large scale water management scenarios is critical to the future growth and wellbeing of the entire metro-area. We cannot overstate the importance of effective cleanups of contaminants which threaten the use of groundwater and the aquifers that host it.

7. Please list any future zoning plans or area plans for the municipality/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary:

None, SRP does not do zoning.

8. Please list any "special projects" projected or anticipated within the East Central Phoenix (38th and Indian School Road) WQARF site boundaries:

Transition of SRP owned groundwater supply wells from irrigation to municipal service (potable supply). Additionally it may become necessary in the future to construct additional groundwater supply wells in close proximity to the East Central Phoenix WQARF site boundaries.

9. If any property is leased (the municipality/utility is the lessor), how long is the lease term?

There is no property in the area where SRP is the lessor.

10. If the property is leased, are there plans to renew the lease and is so, for how long?

N/A

11. Please list any environmental spill of material or waste products that has occurred within the municipality/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary in the past 5 years?

None

12 Is the municipality/utility currently sampling groundwater wells within the East Central Phoenix (38th and Indian School Road) WQARF site? If so, how often is the sampling conducted? Are analytical results being submitted to ADEQ for the groundwater database?

SRP conducts routine groundwater sampling from its wells when possible. Water quality records are available on request, if not already submitted to the ADEQ groundwater database.

13. Does your municipality/utility have an environmental manager or do you outsource environmental management to an environmental consulting firm? If so, please provide the following information:

Name:	David Sultana
Contact:	
Title:	Manager, Water Quality, Waste Management & Field Services

Address:	PAB 352, P.O. Box 52025
	Phoenix, AZ 85233
Phone:	(602) 236-8118

14. Please indicate anticipated groundwater development by the municipality/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary.

Though SRP has no current plans to develop additional groundwater supplies within the East Central Phoenix WQARF site, it is very likely they will be added in the future. The site is completely within the SRP water service area and SRP must be responsive to the water supply needs of its shareholders and customers. To meet its water delivery needs SRP may elect to increase its groundwater use in close proximity to the WQARF site as noted in #8 above. SRP may do this by constructing additional groundwater supply wells or by connecting its existing water supply wells to direct municipal delivery or pipe them to the Arizona Canal to provide greater flexibility in its delivery operations. In any case, there are many scenarios where usage of groundwater in the vicinity of the WQARF site can be expected to increase above historic levels.

15. Are there any groundwater wells owned by the water provider that have been affected by the East Central Phoenix (38th and Indian School Road) WQARF site? If so, please list the ADWR well identification numbers. What is the current status of these wells (e.g.- shut down, still pumping)?

Some of the SRP groundwater supply wells listed in #2 above have shown elevated PCE and TCE (one time above AWQS in 1996) levels since 1990:

17E-8N(55-608431) - PCE concentration as high as  $82 \mu g/L$  and TCE as high as 1.5 ug/L;

17.1E-7.4N (55-607731) – PCE concentrations as high as 5.8 ug/L;

17.9E-7.5N(55-617857) - PCE concentration as high as  $210 \mu g/L$  and one time above AWQS TCE 9.9  $\mu g/L$ ;

18E-8.8N (55-617825) – PCE concentrations as high as 1.1 ug/L;

All of the wells noted above and listed in #2 are currently in service.

16. What is the future use (up to 100 years) for any wells that have been impacted by the East Central Phoenix (38th and Indian School Road) WQARF site?

All of SRP's groundwater supply wells in the vicinity of the East Central Phoenix WQARF site are anticipated to remain in use over the next 100 years. SRP delivers nearly 1,000,000 acre-feet of water per year to the metro Phoenix area. In normal run off years, most of this is supplied from surface water coming from the Salt and Verde Rivers. However, in dry years, groundwater must be pumped to supplement the surface water supplies. SRP's water supply wells are a critical resource especially in drought conditions and it is very important to SRP that it have a reliable supply of water to meet customer and shareholder needs.

Thank you for your time. The Project Manager, Mel Bunkers, or a representative from ADEQ's consultant, Hargis + Associates, Inc., may follow-up on answers provided.

# LAND AND WATER USE STUDY QUESTIONNAIRE FOR MUNICIPALITIES/COUNTY/UTILITIES WITHIN THE EAST CENTRAL PHOENIX (38TH/40TH AND INDIAN SCHOOL ROAD) WQARF REGISTRY SITE

Please answer all questions. Mark "NA" for questions that are not applicable. Mark "UNK" if the answer is unknown to you at the time of completion. Please attach any additional pages as needed.

Water user municipali	ty/county/utility name:	Maricopa County
Date Questionnaire wa	as completed:	May 5, 2014
Name of person comp	leting Questionnaire:	Rita Neill
Contact Name:	Rita Neill	
Title:	Environmental Programs Ma	nager
Division:	Risk Management Department	nt
Address:	222 N. Central Ave, Ste 1110	)
	Phoenix, AZ 85004	
Phone Number:	602-506-5063	

1. What is the current use of your municipality's/county's/utility's property within the limits of the East Central Phoenix (38th and Indian School Road) WQARF site? (Boundaries are approximately Indian School Road to the North, 38th Street to the east, Picadilly Road to the South and 36th Street to the West).

NA

2. Please list the municipality's/county's/utility's properties of concern/boundaries (neighborhood planning committees, zoning, canals, wells) within the East Central Phoenix (38th and Indian School Road) WQARF site boundary.

NA

3. What are the foreseeable plans for the municipality's/county's/utility's property within the East Central Phoenix (38th and Indian School Road) WQARF site boundary as far into the future as they are known and up to 100 years, if possible?

NA

4. Does the municipality/county/utility have a published general plan for the property within the East Central Phoenix (38th and Indian School Road) WQARF site boundary?

NA

5. Are parcel, zoning, or land maps available through the municipality/county/utility? Where are they located?

The County has parcel maps and historical aerials available on the GIS section of its website at www.Maricopa.gov

6. Please list any specific neighborhood concern the municipality/county/utility is aware of within the East Central Phoenix (38th and Indian School Road) WQARF site boundaries? Please list future concerns (e.g.- freeway expansion, water use, water availability, etc.).

That any planned remediation coordinate with Maricopa County Air Quality Department for the necessary permits, ie, NESHAPs, dust control, VOC emissions.

7. Please list any future zoning plans or area plans for the municipality/county/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary:

NA

8. Please list any "special projects" projected or anticipated within the East Central Phoenix (38th and Indian School Road) WQARF site boundaries:

NA

9. If any property is leased (the municipality/county/utility is the lessor), how long is the lease term?

NA

10. If the property is leased, are there plans to renew the lease and is so, for how long?

NA

11. Please list any environmental spill of material or waste products that has occurred within the municipality/county/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary in the past 5 years?

NA

12 Is the municipality/county/utility currently sampling groundwater wells within the East Central Phoenix (38th and Indian School Road) WQARF site? If so, how often is the sampling conducted? Are analytical results being submitted to ADEQ for the groundwater database?

NA

13. Does your municipality/county/utility have an environmental manager or do you outsource environmental management to an environmental consulting firm? If so, please provide the following information:

Name:	Rita Neill
Contact:	Maricopa County Risk Management
Title:	Environmental Programs Manager
Address:	222 N. Central Ave, Ste 1110
	Phoenix, AZ 85004
Phone:	602-506-5063

14. Please indicate anticipated groundwater development by the municipality/county/utility within the East Central Phoenix (38th and Indian School Road) WQARF site boundary.

NA

15. Are there any groundwater wells owned by the water provider that have been affected by the East Central Phoenix (38th and Indian School Road) WQARF site? If so, please list the ADWR well identification numbers. What is the current status of these wells (e.g.- shut down, still pumping)?

NA

16. What is the future use (up to 100 years) for any wells that have been impacted by the East Central Phoenix (38th and Indian School Road) WQARF site?

NA

Thank you for your time. The Project Manager, Mel Bunkers, or a representative from ADEQ's consultant, Hargis + Associates, Inc., may follow-up on answers provided.

RE: Salt River Project 55-202398

Barb,

Thank you for you assistance in recognizing and solving the registration issue on this new SRP production well. I have made the appropriate changes to the well completion report. I am unable to offer any assistance on 55-607713 as Weber Group did not abandon that well. If you should have any further questions please don't hesitate to contact me.

Thank you

Marty Weber

WELL No. 55-202398

# SCHEMATIC DIAGRAM OF PROPOSED PRODUCTION WELL

SRP WELL 18.5E-7.5N

#### ARIZONA DEPARTMENT OF WATER RESOURCES HYDROLOGY DIVISION - WQARF UNIT

#### MEMORANDUM

DATE:	March 17, 2004
TO:	Darlene Sumpter-King, Groundwater Management Support Scott Miller, Phoenix AMA
THROUGH:	Teri Davis, WQARF Unit
FROM:	Andrew Scott, WQARF Unit
SUBJECT:	55-202398 – Salt River Project (SRP)
APPLICATION:	NOI to Replace a Well (Old Well 55-607713)

- 1. The area of groundwater withdrawal activities is located within in proximity to an area of known significant groundwater contamination known as the East Central Phoenix (ECP) Water Quality Assurance Revolving Fund (WQARF) site. The well site is located about 1/2 mile Southwest of the ECP 48th Street and Indian School Road site, about ¹/₂ mile Southeast of the ECP 40th Street and Indian School Road site, and about ½ mile East of the ECP 40th Street and Osborn Road site. According to Arizona Department of Environmental Quality (ADEO) Groundwater Database, sample results from wells located within ¼ of a mile of the withdrawal activities indicate parameter concentrations that exceed Maximum Contaminant Level (MCL) standards for Fluoride (F), Trichloroethylene (TCE), Nitrate (NO₃). In addition, parameter concentrations also exceed Secondary Maximum Contaminant Level (MCL2) standards for Chloride, Total Dissolved Solids (TDS), and pH and Health Based Guidance Levels for Vanadium (V). These samples are taken from the old SRP at this location (55-607713), and the TCE exceedence was from a sample taken in 1986. Recent water quality sampling data were provided by SRP, which indicate that TCE was detected in 55-607713 up to 1990. Water samples from 1991 through 2003 were non-detect (BDL) or below the reporting limit (BRL) for TCE. See attached map and supporting information,
- 2. An NOI to replace 55-607713 was submitted on March 26, 2003. Hydrology/WQARF reviewed the NOI on April 10, 2003 and the drilling authority to replace 55-607713 was issued. The well was not drilled within the 1-year timeframe, so SRP submitted the same application to get a new authority. The original WQARF review found that the well was to be drilled in the Upper Alluvial Aquifer (UAU) and that bedrock (Red Unit?) is expected to be encountered at 300 feet below the land surface, at which point drilling would stop and the well would be completed above the rock.

RE: 55-202398 – SRP NOI to Replace 55-607713 3/17/2004 Page 2

- 3. According to Walker Milici of SRP, the bedrock is expected to be found at a depth of **up** to 300 feet. SRP intends to produce primarily from the UAU and little or no production is expected from the bedrock if the well is even completed in rock.
- 4. Given the recent sampling data provided by SRP, the WQARF Unit has no objections to issuance of the drill card. However, given the history of contamination at the site, it is strongly recommended that the well be completed entirely within the UAU and that if the bedrock is encountered during drilling, the borehole should be backfilled with neat cement or bentonite grout to a depth that is at least 5 feet above the top of the bedrock.
- 5. References: Water Quality Information Maps Program (attached), the Groundwater Code (Arizona Revised Statutes, Title 45, Chapter 2), and the rules adopted thereunder.
- 6. If more information is needed, contact me at (602) 417-2448, ext. 7273. Thank you.

Phoenix AMA Memorandum

To: Darlene Sumpter-King

From: Scott Miller

**Date:** March 15, 2004

Subject: Notice of Intent to Replace Well No. 55-607713 (Replacement Well No. 55-202398 – SRP)

I have reviewed the referenced application and it conforms to AMA policies and statutory requirements and with this memorandum recommend issuance of the permit.

3/8/4

From:Carol NortonTo:WRDtsDate:3/8/04 9:56AMSubject:55-202398 SRP NOI to Replace

The Hydrology Division, Water Resources Section, is in receipt of the above referenced Notice of Intention to Replace a Well. The well being replaced is 55-607713. The diagram of the proposed replacement well meets the Minimum Construction Standards, will be within 660 feet of the original well and will not exceed historic pumpage. The Hydrology Division, Water Resources Section, supports issuance of this drill card.

> Re: Notice of Intent to Drill a Non-Exempt Well Well Registry #55-202398 (SRP 18.5E-7.5N) T2N, R4E, Section 30 ACC

Dear Mr. Milici,

The Department of Water Resources recently approved a Notice of Intent to drill a non-exempt well registered as 55-202398. This well is to be located adjacent to an area of contaminated groundwater known as the East Central Phoenix Water Quality Assurance Revolving Fund (WQARF) remedial site. Please be aware that groundwater produced from the proposed well may not meet applicable federal, state, county or local water quality standards.

According to Arizona Administrative Code R12-15-851, you are required to notify the Department at least two (2) business days in advance of commencement of well drilling activities for the above referenced well(s). You may submit this required notice to the Department by either letter or facsimile, and the Department must receive it at least two (2) business days prior to drilling. If notice is sent via facsimile, please mail the original document to the Department.

Mailing Address: Arizona Department of Water Resources Hydrology/WQARF 500 N. 3rd Street Phoenix, AZ 85004 Facsimile Number: (602) 417-2425

If you have any questions, please contact the Hydrology Division at 602-417-2448 or me at extension 7273.

Sincerely

Andrew Scott Hydrology/WQARF Unit

RE: Notice of Intention to Replace an Existing Non-Exempt Well Registration No. 55-202398; File No. A (2-4) 30 ACC

Dear Mr. Milici:

The Notice of Intention to Replace an Existing Non-Exempt Well in the Same Location within an Active Management Area for Salt River Project has been approved. A copy of the Notice is enclosed for your records. The on-site inspection has been completed and the drill card for the proposed well has been delivered to the driller you selected.

In the event that the location of the proposed well changes, you must notify the Department of Water Resources of the change in writing. A drill card with the correct proposed well location must be in possession of the driller before drilling may commence. If the proposed new well is to be more than 660 feet from the well that it is replacing, then you may be required to obtain a well permit.

Within 30 days of completion of the well, the well driller is required to furnish this Department with a complete and accurate log of the well. In addition, the well owner is required to submit the enclosed Completion Report within 30 days of installation of pump equipment.

Pursuant to the provisions of A.R.S. § 45-604, any person withdrawing groundwater from a well is required to use a water measuring device to record rates of withdrawal in order to provide or allow the computation of an annual volume of pumpage from the well. The total volume of pumpage from the well which is being replaced and the completed new well shall be reported on your Annual Water Withdrawal and Use Report for calendar year 2004.

The Department has issued the authorization to drill this well pursuant to A.R.S. 45-597 of the Groundwater Code. The legal nature of the water withdrawn from the well may be the subject of court action in the future as part of a determination of surface water rights in your area. If there are court proceedings that could affect your well, you will be notified and be given the opportunity to participate.

JANET NAPOLITANO Governor

HERB GUENTHER Director

Salt River Project March 15, 2004 Page two

Please be aware that the withdrawals of the proposed well cannot exceed the historic pumpage of the original well you wish to replace. The historic pumpage of the original well is 1050 acrefeet per year. In addition, if the original well will be used in conjunction with the proposed replacement well, the withdrawals from both wells cannot exceed the historic pumpage of the original well.

If the historic pumpage is exceeded in any calendar year, the well will no longer qualify as a replacement well in the same location, and will instead fall into the category of "new well." This means that you will not be able to pump the well again until you first submit a well impact analysis and obtain a determination from the Department that the well will not cause unreasonably increasing damage to other land and water users.

Hydrology/WQARF strongly recommends that, given the history of contamination at the well site and in the area, the well be completed entirely within the Upper Alluvial Aquifer and that if the bedrock is encountered during drilling, the borehole should be backfilled with neat cement or bentonite grout to a depth that is at least 5 feet above the top of the bedrock.

Under A.R.S. § 45-593, the person to whom a well is registered must notify this Department of any changes in ownership, status or physical characteristics to keep the Well Registry records current and accurate. For such future use, a Request to Change Well Information form is also enclosed.

If you have any questions, please contact Scott Miller at 602-417-2465.

Sincerely, Darlene Sumpter-King

Water Resource Specialist

#### COMPLETION REPORT

- 1. Completion Report to be filed with the Department within 30 days after installation of pump equipment.
- 2. The tested pumping capacity of the well in gallons per minute for a nonflowing well should be determined by measuring the discharge of the pump after continuous operation for at least 4 hours and for a flowing well by measuring the natural flow at the land surface.
- 3. Drawdown of the water level for a non-flowing well should be measured in feet after not less than 4 hours of continuous operation and while still in operation and for a flowing well the shut-in pressure should be measured in feet above the land or in pounds per square inch at the land surface.
- 4. The static groundwater level should be measured in feet from the land surface immediately prior to the well capacity test.

EXEMPT WFL

#### AN EXEMPT WELL

Section 45-596, Arizona Revised Statutes, provides: A person may not drill or cause to be drilled any well or deepen or replace an existing well without first filing a Notice of Intention to Drill with the Department on a form prescribed and furnished by the Department. The well shall be completed within one year after the date of Notice. An exempt well means a well having a pump with a maximum design capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An exempt well may include the non-commercial irrigation of not more than 1 acre of land.

#### INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

#### General Instructions

- 1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in <u>duplicate</u> with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
- An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
- 3. No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
- 4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
- 5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

#### INSTRUCTIONS FOR REGISTRATION QUESTIONS

- 1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
- If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
- 3. a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.
- 4. Show all purposes for which the water is used.

4

- 5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial: If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.
- 7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- 8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

#### INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

#### General Instructions

- 1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in <u>duplicate</u> with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
- 2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
- 3. No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
- 4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
- 5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

#### INSTRUCTIONS FOR REGISTRATION QUESTIONS

- The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
- If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
- 3. a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.
- 4. Show all purposes for which the water is used.
- 5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.
- Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

#### INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

#### General Instructions

- A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in <u>duplicate</u> with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
- 2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
- 3. No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
- 4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
- 5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

#### INSTRUCTIONS FOR REGISTRATION QUESTIONS

- 1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
- 2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
- 3. a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.
- 4. Show all purposes for which the water is used.
- 5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

- Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

Re:	File No(A	-2-3)25 obb
	Application	<u>-2-3)25 obb</u> No. <u>S-683</u>
	Permit No.	S-666

Gentlemen:

Your application for a permit to drill a well in Twp. 2 North , Rge. 3 East

Section 25 , NW 1/4 NW 1/4 SW 1/4 has been approved. Your permit is enclosed.

Also enclosed are a:

- WELL DRILLING CARD, which should be in the hands of the driller before construction of the well is started;
- REPORT OF WELL DRILLER form, which shall be filled in and sent to us within thirty days after completion of the well;
- REPORT OF EQUIPMENT INSTALLED form, which shall be filled in and sent to us within thirty days after the installation of the pumping equipment.

In the event it is necessary to change the location of the proposed well you should obtain the written permission of the State Land Commissioner before proceeding with the drilling.

Very truly yours,

WATER DIVISION

By: Donald LeMaster

# **REGISTRATION OF EXISTING WELLS**

READ INSTRUCTIONS ON BACK OF THIS FORM BEFORE COMPLETING PRINT OR TYPE - FILE IN DUPLICATE

SALT RIVER PROJECT AGRICULTURAL IMPROVEMENT AND POWER DISTRICT

## INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

## General Instructions

- 1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in <u>duplicate</u> with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
- 2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
- 3. No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
- 4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
- 5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

rij.

#### INSTRUCTIONS FOR REGISTRATION QUESTIONS

- The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
- If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
- 3. a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.
- 4. Show all purposes for which the water is used.

.

- 5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm  $c_c$  etc., fill in the appropriate title.
- Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- 8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

## INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

#### General Instructions

- 1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in <u>duplicate</u> with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
- 2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
- 3. No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
- 4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
- 5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

#### INSTRUCTIONS FOR REGISTRATION QUESTIONS

- 1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
- If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
- 3. a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.

- 4. Show all purposes for which the water is used.
- 5. If the well is used for irrigation, give the number of acres, irrigated in 1980 from the well.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.
- Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

e:	File No. A	(2-3)25 bbb	
	Application	No. S-776	
	Permit No.		

Gentlemen:

Your application for a permit to drill a well in Twp. 2 North , Rge. 3 East

Section 25 , NW 1/4 NW 1/4 has been approved. Your permitis enclosed.

Also enclosed are a:

- WELL DRILLING CARD, which should be in the hands of the driller before construction of the well is started;
- REPORT OF WELL DRILLER form, which shall be filled in and sent to us within thirty days after completion of the well;
- REPORT OF EQUIPMENT INSTALLED form, which shall be filled in and sent to us within thirty days after the installation of the pumping equipment.

In the event it is necessary to change the location of the proposed well you should obtain the written permission of the State Land Commissioner before proceeding with the drilling.

Very truly yours,

WATER DIVISION

## INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

#### General Instructions

- A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in <u>duplicate</u> with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
- 2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
- 3. No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
- 4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
- 5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

### INSTRUCTIONS FOR REGISTRATION QUESTIONS

- 1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
- If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
- 3. a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.
- 4. Show all purposes for which the water is used.
- 5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.
- Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- 8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

#### INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

#### General Instructions

- 1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in <u>duplicate</u> with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
- 2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
- No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
- 4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
- 5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

#### INSTRUCTIONS FOR REGISTRATION QUESTIONS

- 1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
- If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
- 3. a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.
- 4. Show all purposes for which the water is used.
- 5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.
- 7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- 8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

Salt River Valley Water Users' P. O. Box 1980	Assoc.	Re: Application for Permit to Drill for Well <b>S-791</b>
Phoenix, AZ 85001	••••••	Fíle # A(2-3)25 daa
		Dated 2-16-65

The State Land Department, Water Rights Division is engaged in the processes of bringing its well files up to date.

Arizona Revised Statutes 45-306, 45-307, and 45-313 deal with Applications for Permit to Construct Irrigation Well, Filing of Log by Driller, Failure or Refusal to File Reports on Notices and Penalty.

Critical information included in these statutes requires that:

Gentlemen:

- 1. A well must be completed within one year of filing (in case of failure to complete a well within one year a new Application for Permit to Construct Irrigation Well may be filed);
- 2. Upon completion of drilling, a copy of the log, and other pertinent data shall be filed by the driller with the State Land Department; and
- 3. A person who fails or refuses to make any of these reports, give the notices required, or cooperate with the Department, is guilty of a misdemeanor and subject to a fine.

In the event the referenced well has been completed, please forward log, and other pertinent completion data to this Department within 30 days.

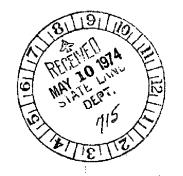

If no response is forthcoming, we will be compelled to assume that the well is not complete and the related file retired as cancelled.

Yours very truly,

andrew I. Better

NOTE: We usually receive the Report of Equipment Report covering the wells but not the Driller's report. That is the report we must have to complete 5-73 your files. Water Division

• •

Gentlemen:

Your application for a permit to drill a well in Twp. 2 North , Rge. 3 East

Section 25 , NE 1/4 NE 1/4 SE 1/4 has been approved. Your permit is enclosed.

Also enclosed are a:

- WELL DRILLING CARD, which should be in the hands of the driller before construction of the well is started;
- REPORT OF WELL DRILLER form, which shall be filled in and sent to us within thirty days after completion of the well;
- REPORT OF EQUIPMENT INSTALLED form, which shall be filled in and sent to us within thirty days after the installation of the pumping equipment.

In the event it is necessary to change the location of the proposed well you should obtain the written permission of the State Land Commissioner before proceeding with the drilling.

Very truly yours,

WATER DIVISION

Indicate depth at which water was first encountered, and the depth and thickness of water bearing bads. If water is artesian, indicate depth at which encountered, and depth to which it rose in well.

I hereby certify that I have read the foregoing statements, and that each and all of the items therein contained are true to the best of my knowledge and belief. SALT RIVER VALLEY WATER USERS * ASSOCIATION

#### INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

#### **General Instructions**

- A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in <u>duplicate</u> with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
- 2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
- 3. No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
- 4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
- 5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

#### INSTRUCTIONS FOR REGISTRATION QUESTIONS

- The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
- If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
- 3. a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.
- 4. Show all purposes for which the water is used.

الأحر

- 5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.
- 7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

#### 6/14/82

#### Gentlemen:

Upon purchasing my home, I was informed by the previous owner that there was a well on the property. I believe the well is plumbed for irrigation purposes only; however due to the fact that a pump has never been attached, I am unable to provide you with any statistical information.

³ My property consists of a little less than 1 acre. In the event I ever wish to have the well operational, I am forwarding this application to you. Further if you deem this well as a "non-exempt" well, please contact me and I will forward the registration fee.

Thank you, d ĸ Linda Riskas

3713 E. Camelback Phoenix, AZ 85018

# INSTRUCTIONS FOR COMPLETING REGISTRATION FORM GENERAL INSTRUCTIONS

- 1. Pursuant to Arizona Revised Statute (A.R.S.) § 45-593(A), all known wells within the State of Arizona were to be registered with the Department of Water Resources no later than midnight, June 12, 1982. Accordingly, all wells that are discovered after that date must be registered with the Department. Use this form in lieu of a Notice of Intention to Drill form for all wells drilled after June 12, 1980.
- 2. An "existing well" must be registered with the Department. An "existing well" is a well which was drilled before June 12, 1980 and which is not abandoned or sealed or a well which was not completed on June 12, 1980 but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on June 12, 1980.
- 3. A well drilled after June 12, 1980 without first filing a Notice Of Intention to Drill pursuant to A.R.S. § 45-596 or obtaining a well permit pursuant to A.R.S. § 45-599 must also be registered with the Department.
- 4. Pursuant to A.R.S. § 45-593(D), "within thirty days after a change of ownership of real property, the new owner shall notify the Director in writing of the existence of any open well or wells on the property which the new landowner has discovered. Thereafter, the owner shall report the existence of any open well on the property within ten days after the owner discovers the well."
- 5. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater for a non-irrigation use, including the application of groudwater on less than two (2) acres of land to grow crops for sale or human consumption or for use as feed for livestock, range livestock or poultry. A "Non-Exempt Well" means a well that is not an "Exempt Well".
- 6. In accordance with A.A.C. R12-15-151(B)(4), a \$10 registration fee and a \$10 late fee is required for Non-Exempt wells. For Registration of exempt wells, only a \$10 late fee is required. Check the appropriate well type on the front of this form, submit the fee, and mail to P.O. Box 458, Phoenix, Arizona 85001-0458 or hand deliver to 500 North 3rd Street, Phoenix, Arizona.

### **INFORMATION FOR REGISTRATION QUESTIONS**

- 1. This form must be filed in duplicate with original signatures on both copies.
- 2. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of the State.
- 3. If you own any type of well drilled on or after June 20, 1968, or an existing irrigation well drilled prior to June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2.
- 4. Provide the Assessor's I.D. Number. This information can be obtained from your recorded deed, or by contacting your county assessor's office.
- 5. Furnish complete well location to include the ¹/₄ ¹/₄ sections. Section Number. Township, and Range (**Required**). If this required information is not known, you may contact the Mapping Division of the County Assessor's Office in which the property is located.
- 6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., provide the appropriate title of person signing.
- 7. Complete the section on Well Data (item 9) with the most accurate information available to you. If data for items (a) thru (f) is not available, write "unknown" in the appropriate blank. For Item f, if the month and day are unknown, at least an approximate year the well was completed is required.
- 8. Provide the legal description of where the water will be used.
- 9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished.

RE: Well Registration No. 55-807925 File (location) No. A(2-3) 24 DBC

Dear Well Owner:

Enclosed is a copy of the Well Registration form recently submitted to this Department. Your cancelled check can serve as your receipt. The Registration Number assigned is referenced above.

Also enclosed is a blank Change of Well Information form. This form should be used for any **future** changes to this well, as follows:

- Change of ownership of the well; (lower half of form)
- CHANGE OF ADDRESS
- Change in well data, such as pump capacity
- CORRECTION of legal description as to location of the well
- Change of well driller, PRIOR to drilling the well
- Amending information previously filed

Please contact this office if further assistance or information is required.

Sincerely,

loria Mos

# **1.0 INTRODUCTION**

The Arizona Department of Environmental Quality (ADEQ) has prepared this Remedial Objectives (ROs) Report for the 40th Street and Indian School Road Water Quality Assurance Revolving Fund (WQARF) Registry Site (the Site) to meet requirements established under Arizona Administrative Code (A.A.C.) R18-16-406. This RO Report relies upon the Land and Water Use Study Report (Use Report) dated April 2014. The Use Report is contained in Appendix F of the Site Remedial Investigation (RI) Report prepared by Hargis + Associates, Inc. (H+A) for ADEQ.

ROs are established for the current and reasonably foreseeable uses of land and waters of the state that have been or are threatened to be affected by a release of a hazardous substance. Pursuant to A.A.C. R18-16-406(D), it is specified that reasonably foreseeable uses of land are those likely to occur at the site and the reasonably foreseeable uses of water are those likely to occur within one hundred years unless site-specific information suggests a longer time period is more appropriate.

Reasonably foreseeable uses are those likely to occur, based on information provided by water providers, well owners, land owners, government agencies, and others. Not every use identified in the Use Report will have a corresponding RO. Uses identified in the Use Report may or may not be addressed based on information gathered during the public involvement process, limitations of WQARF, and whether the use is reasonably foreseeable.

The ROs must be stated in the following terms: (1) protecting against the loss or impairment of each use; (2) restoring, replacing, or otherwise providing for each use; (3) when action is needed to protect or provide for the use; and (4) how long action is needed to protect or provide for the use.

The ROs chosen for the site will be evaluated, during remedy screening, in the feasibility study (FS) phase of the WQARF process. The FS will evaluate specific remedial measures and strategies required to meet ROs. A remedial strategy is one or a combination of six general strategies identified in Paragraph B.4 of Arizona Revised Statutes (A.R.S.) 49-282-06; plume remediation, physical containment, controlled migration, source control, monitoring, and no action. A remedial measure is a specific action taken in conjunction with remedial strategies to achieve one or more ROs, for example, well replacement, well modification, water treatment, water supply replacement, and engineering controls.

The FS will propose at least three remedies; a reference remedy and two alternative remedies, capable of meeting ROs. A reference remedy is a combination of remedial strategies and measures capable of achieving ROs, and is compared with alternative remedies for purposes of selecting a proposed remedy. An alternative remedy is a combination of remedial strategies and measures different from the reference remedy; alternative remedies are compared with the reference remedy for purposes of selecting a proposed remedy. Proposed remedies will also be generally compatible with future land use specified by land owners.

Public comments were reviewed and will be considered in the development of the final remedy.

### 2.0 REMEDIAL OBJECTIVES FOR LAND USE

The Site is located in the City of Phoenix (COP) and is bounded approximately by Devonshire Avenue to the north, 40th Street to the east, East Piccadilly Road to the south and 38th Place to the west. The contaminant of concern (COC) for the Site is tetrachloroethene (PCE). However, trichloroethene (TCE) has been historically detected in Site area media. After several years of investigations, the source area of the PCE was determined to be at the Kachina Cleaners facility and the former Allen's Cleaners facility.

Early Response Actions (ERAs) performed at the Site included installation of three soil vapor extraction (SVE) wells and six air sparge (AS) wells in addition to the operation of a SVE/AS system. These ERAs reduced the PCE detected in the groundwater and vadose zone soil at the Site. In 2005, the SVE/AS system was decommissioned and removed from the former Allen's Cleaners removing approximately 33 pounds of PCE from the vadose zone throughout its operation.

Typically, ROs for land use are established for those properties known to be contaminated with hazardous substances above a Soil Remediation Level (SRL) or a risk-based level. Several phases of investigation have been conducted including soil and soil vapor sample collection, and groundwater monitoring well installation and sampling. The results of these investigations have indicated that volatile organic compounds (VOCs), primarily PCE, are present in soil, soil vapor, and groundwater in the vicinity of the Site.

#### 2.1 Summary of Current and Reasonably Foreseeable Land Use

Generally, the Site is located in a mixed urban, commercial and residential area. Based on the current zoning maps provided by the COP, the Site is zoned as residential (single and multiple family) and commercial (restricted, retail, intermediate, and high density). Based on future land use plans provided by the COP, there are no immediate plans to change the land use or zoning for the areas of the COP within and adjacent to the Site.

#### 2.2 Soil Remedial Objective

Although the former drycleaner property is currently zoned for commercial use, reasonably foreseeable use may be residential. Therefore, residential SRLs apply and the ROs for land use at the former drycleaner property are:

To restore soil conditions to the remediation standards for intended end use specified in A.A.C. R18-7-203 (specifically background remediation standards prescribed in R18-7-204, predetermined remediation standards prescribed in R18-7-205, or site specific remediation standards prescribed in R18-7-206) that are applicable to the hazardous substances identified (PCE). This action is needed for the present time and for as long as the level of contamination in the soil threatens its intended end use.

## 3.0 REMEDIAL OBJECTIVES FOR GROUNDWATER USE

The groundwater use portion of the Use Report is an inclusive summary of information gathered from the Arizona Department of Water Resources (ADWR), water providers and municipalities. The water providers within the Site are the COP and SRP.

## 3.1 Summary of Current and Reasonably Foreseeable Groundwater Use

The Site lies within the Phoenix Active Management Area (AMA). The Phoenix AMA was created by the Arizona Groundwater Management Code passed in 1980 and covers approximately 5,646 square miles in central Arizona. All groundwater withdrawn from any AMA must occur under a groundwater right or permit, unless groundwater is being withdrawn from an exempt well.

According to ADWR records, there are seven (7) non-exempt withdrawal wells located within one mile of the Site; all owned and operated by SRP. ADWR records indicate ADWR records indicate that there are five (5) exempt withdrawal wells located within one-mile of the Site; all five wells have an intended use for domestic irrigation. There are no grandfathered rights in the Site. The City of Phoenix and SRP have service area rights in the Site, however, of the two, only SRP is currently pumping groundwater in the Site.

Questionnaires were mailed to the COP, Maricopa County and SRP to obtain information regarding current and future uses of groundwater within the Site. The following sections identify current and foreseeable groundwater uses within the Site and proposed ROs.

The Site is in the COP and the Phoenix AMA, an area where groundwater use is controlled and regulated. The COP does not have groundwater wells within the Site but has indicated that it may install future municipal wells, within the Site, in the future. Currently a portion of the groundwater within the Site is contaminated with PCE that would restrict use of the groundwater by the COP if the city wanted to use the groundwater for municipal purposes.

SRP operates and maintains seven (7) irrigation wells within approximately one-mile of the Site boundaries. The last groundwater sample collected from SRP well 17E-8N in June 2011 contained PCE at a concentration of 2.2  $\mu$ g/L, and in April 2013, SRP reported PCE at a concentration of 3  $\mu$ g/L in well 17.9E-7.5N. Groundwater quality data collected from these wells indicates that PCE concentrations in these two SRP wells are below the AWQS of 5  $\mu$ g/L. Groundwater pumpage at these wells has been intermittent in the recent past, but the wells can be activated at any time.

Although recent use of the irrigation wells in and adjacent to the Site has been intermittent, SRP has no plans to eliminate any of these wells from their system. Based on demand analysis, SRP has indicated it will continue to need the wells in the area to remain operational, especially during dry years. SRP anticipates all its properties in the vicinity of ECP WQARF Area will remain in use over the next 100 years. Additionally, SRP anticipates that its groundwater supply wells that are in the vicinity will likely transition from irrigation to municipal service (potable supply) within this time period.

### **3.2 Groundwater Remedial Objective**

Current groundwater use in the Site is for irrigation, however, the regional aquifer is considered to be a drinking water source for the COP and SRP. Therefore, the current and future use of the regional aquifer must be protected.

The remedial objective for regional groundwater at the site is to protect for the use of the groundwater supply by the COP and SRP from contamination at the Site. This action is currently needed and will be needed if/when groundwater use changes to municipal/drinking water uses. This action will be needed for as long as the level of contamination in the groundwater threatens the use of the regional groundwater for municipal/drinking water uses.

## 4.0 **REMEDIAL OBJECTIVES FOR SURFACE WATER USE**

The surface water use portion of the Use Report indicates that surface water usage within the Site is for residential irrigation. The surface water source comes from groundwater wells outside the Site.

### 4.1 Summary of Current and Reasonably Foreseeable Surface Water Use

Surface water for use in the Site is provided/distributed by an active flood irrigation district of SRP, for residential irrigation. This water is supplied, by the SRP, from sources outside the Site.

The Site area is situated within an active flood irrigation district of SRP. SRP lateral 6.1 receives water from the Arizona Canal, SRP well 17.9E-7.5N, and SRP 17E-8N. Water from SRP lateral 6.1 is used for irrigation and also discharges into the Grand Canal. Grand Canal, also used for irrigation, is located approximately two (2) miles southwest of the Site. Future plans for the Grand Canal include a drinking water treatment plant that may be constructed at the end of the Grand Canal. The construction of the treatment plant would change the end use of the canal water requiring that water discharged to the canal meet stricter water quality criteria than what is currently required.

### 4.2 Surface Water Remedial Objective

Current surface water use in the Site is for irrigation and comes from groundwater sources outside the site; therefore no RO is necessary at this time.

# APPENDIX A

# <u>COMMENTS RECEIVED FROM ORAL AND WRITTEN SOLICITATIONS FOR</u> <u>PROPOSED REMEDIAL OBJECTIVES</u>

# A <u>COMMENTS RECEIVED FROM ORAL AND WRITTEN SOLICITATIONS FOR</u> <u>PROPOSED REMEDIAL OBJECTIVES</u>

As per A.A.C. R18-16-406(I), a community advisory board (CAB) meeting was held at Arcadia High School on February 5, 2015 during the 45-day to 90-day public solicitation period for the ROs. The purpose of the meeting was to solicit and consider proposed ROs for the East Central Phoenix 40th Street and Indian School Road WQARF Site. The meeting gave a public forum for oral and written comments to be submitted. ADEQ received two oral comments on the ROs during the meeting.

Mr. Nathan Nelson

1) Mr. Nelson indicated that there were not any concentration levels referenced and wondered if there was a target in mind. Mr. Nelson's comment is to make sure the clean-up goals are whatever standard is set for the intended use.

### Ms. Jolene Morris

1) Ms. Morris asked if the RO is a living document due to the fact, if a standard changes in the future (either higher or lower) then the new standard will be followed/used.

APPENDIX H

REMEDIAL OBJECTIVES RESPONSIVENESS SUMMARY

# REMEDIAL OBJECTIVES REPORT 40TH Street and Indian School Road WQARF Registry Site Phoenix, Arizona

**Prepared By:** 

Arizona Department of Environmental Quality Remedial Projects Unit

April 30, 2015

### **REMEDIAL OBJECTIVES REPORT**

40TH Street and Indian School Road WQARF Registry Site Phoenix, Arizona

#### **INTRODUCTION**

Pursuant to the requirements of the Arizona Administrative Code (ACC) R-18-16406(H) the Arizona Department of Environmental Quality (ADEQ) has prepared this comprehensive responsiveness summary for comments received regarding the remedial objectives for the *Draft Remedial Investigation Report, 40th Street and Indian School Road WQARF Site, Phoenix, Arizona* dated November 25, 2015. The 40th Street and Indian School Road Water Quality Assurance Revolving Fund (WQARF) site (Site) Draft Remedial Investigation (RI) Report was made available for public review and comment on December 18, 2015 for 60 days. A community advisory board (CAB) meeting was held at Arcadia High School on February 5, 2015 during the 60-day public comment period. The purpose of the meeting was to receive oral and/or written comments on the Draft RI Report and to solicit and consider proposed remedial objectives. Regarding the solicited remedial objectives for 38th Street and Indian School Road Draft RI Report, ADEQ received two oral comments and no written comments, during the CAB meeting on February 5, 2015.

#### **Oral Comments**

#### Nathan Nelson

- 1. Mr. Nelson indicated that there were not any concentrations levels referenced and wondered if there was a target in mind. ADEQ indicated it was applied by the resource use and the current RO clean-up goal is set by whatever use it is intended for (e.g. drinking water as opposed to irrigation water). Mr. Nelson's comment is to make sure the clean-up goals are whatever standard is set for the intended use.
- ADEQ Response: Comment is noted.

#### **Jolene Morris**

- 1. Ms. Morris asked if the RO is a living document due to the fact, if a standard changes in the future (either higher or lower) then the new standard will be followed/used. ADEQ stated that was correct.
- ADEQ Response: Should new standards be developed for the targeted resource use that could change the established RO clean-up goal, ADEQ will evaluate the necessity for an update to the clean-up goal.

#### Written Comments

None Received

40th Street and Indian School Road WQARF Registry Site Phoenix, Arizona

### **INTRODUCTION**

Pursuant to the requirements of the Arizona Administrative Code (ACC) R-18-16406(H) the Arizona Department of Environmental Quality (ADEQ) has prepared this comprehensive responsiveness summary for comments received on the *Draft Remedial Investigation Report*, 40th Street and Indian School Road WQARF Site, Phoenix, Arizona dated November 25, 2015. The 40th Street and Indian School Road Water Quality Assurance Revolving Fund (WQARF) site (Site) Draft Remedial Investigation (RI) Report was made available for public review and comment on December 18, 2015 for 60 days. A community advisory board (CAB) meeting was held at Arcadia High School on February 5, 2015 during the 60-day public comment period. The purpose of the meeting was to receive oral and/or written comments on the Draft RI Report and to solicit and consider proposed remedial objectives. ADEQ did not receive oral or written comments from CAB members during the CAB meeting on February 5, 2015, regarding the 40th Street and Indian School Road Draft RI Report.
