1.0 INTRODUCTION

This report was prepared by Clear Creek Associates (Clear Creek) as part of the Broadway-Pantano Landfill Operable Unit (LOU) Remedial Investigation (RI) report for the Arizona Department of Environmental Quality (ADEQ) to document the collection and analyses of soil gas samples from deep-nested soil gas probes. The deep-nested soil gas probes are located at the former Broadway North Landfill (BNL) and the former Broadway South Landfill (BSL). The objectives of the soil gas monitoring were:

- To evaluate trends of volatile organic compounds (VOCs) and landfill gas (methane, carbon dioxide, and oxygen) concentrations in soil gas by comparing with historical data.
- To evaluate whether soil equivalent concentrations¹ of VOCs exceed Arizona Soil Remediation Levels (SRLs) (ADEQ, 2007).
- To compare soil equivalent concentrations with minimum Groundwater Protection Levels (GPLs) (ADEQ, 1996, revised 2008) to evaluate risk to groundwater.
- To assess rebound of VOCs in the vadose zone at BNL since the Soil Vapor Extraction/Air Injection (SVE/AI) remediation system was turned off in 2002.

¹ Soil gas concentrations were converted to soil concentrations (assuming equilibrium partitioning of the VOCs) to yield “soil equivalent” concentrations, based on a formula in the ADEQ Soil Vapor Sampling Guidance (2011). The dimensionless Henry’s Law constant and the soil organic carbon-water partitioning coefficient, used in the equation, were obtained from USEPA (2013) if not provided in the ADEQ (2011). The soil equivalent concentration was not calculated if the constants for a particular compound were not provided by ADEQ (2011) or USEPA (2013).

2.0 BACKGROUND

The closed BNL has been identified as the primary source of VOCs in groundwater within the Broadway-Pantano WQARF site. The closed BSL is considered to be a secondary source. Former sand and gravel mining operations on the west side of the Pantano Wash (in the vicinity of the BNL and BSL) that operated from 1936 through 1998 and were used as “wildcat” dumping sites are considered a third source (Stantec, 2012). The chemicals of concern (COCs) that recently have been detected in groundwater above their respective Aquifer Water Quality Standards (AWQSS) are tetrachloroethene (PCE), trichloroethene (TCE), and vinyl chloride (VC). Cis-1,2-dichloroethene (cis-1,2-DCE) and methylene chloride were considered COCs in the past; they have not been detected since 2005 above AWQSSs.

An SVE/AI system was installed at BNL in June 2000 by the City of Tucson (COT) and Pima County. It began operating on June 26, 2000. By September 10, 2002, the system had removed over 2,200 pounds of non-Freon VOCs, including approximately 1,260 pounds of PCE. After the soil gas concentrations declined, the SVE/AI system was shut down on September 10, 2002 and it has remained off since that time (Stantec, 2008). A comparison of pre-SVE/AI PCE concentrations from April 2000 to post-SVE/AI PCE concentrations in December 2002, shows that about half of the monitoring points were non-detect for PCE after shutdown. Most of the remaining monitoring points showed reductions of 96 to 99+ percent relative to pre-SVE/AI concentrations (Figure E5 and Attachment E4-1).

Since the SVE/AI operations at BNL were discontinued, five rebound tests have been conducted to evaluate whether residual adsorbed phase VOCs have diffused into pore spaces, thus posing further potential impacts to groundwater. After airflow that is induced by SVE/AI stops, it is not unusual to observe VOC concentrations in soil gas “rebound” as the sorbed VOCs move by diffusion from the sorbed phase to the vapor phase. The rebound tests may also identify evidence of ongoing vapor releases at the site. The first rebound test at BNL was conducted on December 17-19, 2002; the second was conducted on May 29, 2003; the third was conducted on June 17-18, 2004; the fourth was conducted on May 8-12, 2006; and the most recent rebound test was conducted on January 22-23, 2008 (Stantec, 2008).

VOC concentrations in soil gas at BSL (and associated VOC concentrations in groundwater below BSL) were generally been lower than those at BNL prior to operation of SVE at BNL. Shallow landfill gas mitigation systems operate at the site to mitigate offsite migration and possible intrusion of methane into buildings. Unlike BNL, the BSL does not have an SVE/AI system to remove VOCs in the deeper vadose zone.

Additional background information can be found in the main text of this RI report.

3.0 SUMMARY OF FIELD ACTIVITIES

Field activities included soil gas purging and sampling from deep-nested soil gas probes located at BNL and BSL. Field activities were performed by Clear Creek and documented in field notebooks (Appendix J of this RI report) and Soil Vapor Sampling Forms (Attachment E1).

3.1 SITE AND SAMPLING LOCATIONS

Soil gas samples were collected from the following deep-nested soil gas probes at BNL²:

- DP-1 vapor monitoring probes at 50, 125, 150, and 193³ feet below land surface (bls)
- DP-2 vapor monitoring probes at 50, 100, 150, and 195 feet bls
- DP-3 vapor monitoring probes at 50, 100, 150, and 190 feet bls
- DP-4 vapor monitoring probes at 50, 100, 150, 200, 250, and 300 feet bls
- DP-5 vapor monitoring probes at 50, 100, 150, 200, 250, and 300 feet bls
- DP-7 vapor monitoring probes at 50, 100, 150, 200, 250, and 300 feet bls
- R-068A injection well with vapor probes at 50, 100, 150, and 200 feet bls
- R-069A injection well with vapor probes at 50, 100, and 150 feet bls
- R-070A extraction well nested probes at 50, 100, and the wellhead screened interval from 158-227 feet bls
- R-071A extraction well nested probes at 50, 100, and the wellhead screened interval from 158-227 feet bls
- R-072A extraction well nested probes at 50, 100, and the wellhead screened interval from 157-227 feet bls

² On April 22-23, 2014, at the recommendation of the City of Tucson, ADEQ had Clear Creek Associates measure the total depth of each deep soil gas probe at BNL and BSL. The results of this gauging are as follows: (1) DP-2 and DP-3 have blockages at approximately 6' bls and 20' bls, respectively. This structural damage calls into question the validity of the probe data. Therefore, ADEQ did not use the DP-2 or DP-3 data in drawing conclusions for the Final LOU RI Report and these data have been flagged accordingly in the tables and figures. (2) The measured depths for the DP-1-150' and DP-1-193' soil gas probes were 191.45' bls and 153.95' bls; ADEQ is surmising that the probes were mislabeled from the beginning and the tables, figures, and attachments have been revised accordingly. (3) Excluding the measurements from DP-2 and DP-3, the average deviation from the "nominal" probe depth was approximately + 2'; therefore, the probe depths listed below, e.g., "50, 125, 150, and 195" should be viewed as approximate. (See Attachment E5).

³ The depths on the probes were labeled incorrectly. Sample DP-1-150 was actually collected from the probe screened at 193 feet and DP-1-193 was collected from the probe screened at 150 feet.

- R-073A extraction well nested probes at 50, 100, and the wellhead screened interval from 158-228 feet bls
- R-074A extraction well nested probes at 50, 100, and the wellhead screened interval from 156-225 feet bls
- R-075A extraction well nested probes at 50, 100, and the wellhead screened interval from 157-227 feet bls
- WR-273A vapor monitoring probes at 50, 130, 220, and 300 feet bls
- WR-274A vapor monitoring probes at 50, 130, 300⁴, and the wellhead screened from 315 to 365 feet bls
- WR-275A vapor monitoring probes at 50, 130, 220, and 300 feet bls

Soil gas samples were collected from the following deep-nested soil gas probes at BSL:

- WR-434A monitoring probes at 50, 150, 250 and 350 feet bls
- BP-22 vapor monitoring probes at 200, 250, and 300 feet bls
- BP-23 vapor monitoring probes at 200, 250, and 300 feet bls
- BSDP-1 vapor monitoring probes at 100, 150, 200, and 250 feet bls
- BSDP-2 vapor monitoring probes at 100, 150, 200, 250, and 300 feet bls
- BSDP-3 vapor monitoring probes at 50, 100, and 150 feet bls
- BSDP-4 vapor monitoring probes at 50, 100, and 150 feet bls

The locations of the deep-nested soil gas probes are shown on Figures E1 and E2. Construction information is provided in Appendix B of this RI report.

The DP-6 probes at BNL were not sampled because they were vandalized prior to sample collection. It was not possible to collect a sample from R-069A-200 because there was no air flow from the probe, indicating a possible obstruction.

At BP-22, BP-23, BSDP-1, and BSDP-2 the probes at 350 feet bls were not sampled because there was no airflow; the screened intervals were likely below the water table, based on February 2013 groundwater

⁴ Note that the one-inch diameter probe screened at 300 feet bls was originally thought to be screened at 220 feet bls, so a sample ID of WR-274A-220 was given, as shown on Table E1, Table E3, the laboratory reports, and field notes. No sample was collected from the probe screened at a depth of 220 feet. The samples designated as WR-274A-220 and WR-274A-300 (a 5-inch well) in this report are screened in the same interval of filter pack, but have slightly different screen depths.

elevation monitoring. (In February 2013, depths to groundwater below the well measuring point were 343.75 feet at BP-22 and 341.32 feet at BP-23. The nearest groundwater monitoring well to BSDP-1 is WR-367-A where groundwater was measured at a depth of 342.87 feet in February 2013. The nearest groundwater monitoring well to BSDP-2 is BP-11 where groundwater was measured at a depth of 346.68 feet in February 2013.) Also at BSDP-1, the probe screened at 300 feet was also not sampled. Although the screened interval was not likely in the saturated zone based on recent groundwater level monitoring, there was no air flow, indicating a possible obstruction.

3.2 ACCESS

ADEQ contacted the property owners and obtained access to the deep-nested soil gas monitoring probes.

3.3 PERMITTING

Prior to the start of fieldwork, Clear Creek contacted the Pima County Department of Environmental Quality (PDEQ) regarding the need to permit and/or treat soil vapor that would be generated during purging of the soil vapor probes. PDEQ said that, based on the very small volume of effluent, there are no permitting or treatment requirements.

3.4 SAMPLING METHODOLOGY

The deep-nested soil gas probes at BNL and BSL were purged and sampled using the methodology described in the RI Work Plan (Clear Creek, 2013). Photographs and a schematic drawing of the sampling systems are included in Attachment E2.

3.4.1 Soil Gas Purging

The deep-nested soil gas probes at BSL and BNL were purged using a Stinger® 2.5 gallon wet/dry vacuum (Model WD20250) pump capable of pumping 48 ft³/minute. During purging, the vacuum, flow rate, estimated purge volume, and other pertinent field observations were monitored and recorded on the Soil Vapor Sampling Forms (Attachment E1). In addition, landfill gas (LFG) (methane, carbon dioxide, and oxygen) concentrations were measured periodically using a Landtec Gem 500 LFG monitor. The LFG monitor was calibrated by the supplier prior to delivery, according to the manufacturer's instructions. The LFG concentrations did not vary significantly during the purging of most of the deep-

nested soil gas probes, and thus were considered stable and representative of ambient conditions at the time of sample collection. In accordance with Section 5.4.1 of the ADEQ Soil Vapor Sampling Guidance document (2011), three to five internal volumes⁵ of the sample system were purged prior to collection of the soil gas sample. Samples collected from probes where the LFG concentrations varied significantly during purging are also considered representative samples because of the removal of the three to five internal volumes of the sampling system should according to ADEQ (2011) “ensure that vapor concentration entering a sampling container is 95% or greater representation of vapor concentrations in surrounding soil.” Tables E1 and E2 show the LFG concentrations measured right before sample collection.

The flow rate and vacuum in the probe and sampling manifold were controlled using a bleed valve installed between the pump and the flow meter. Because these probes are deep, the default purging rate of 200 milliliters per minute (ml/min), as recommended by the ADEQ Soil Vapor Sampling Guidance document (2011), would result in excessive (longer than one hour) purge times. Therefore, these probes were purged at higher flow rates, which is acceptable practice according to the guidance document in such cases.

3.4.2 Soil Gas Sample Collection

After purging, the pump was turned off and soil gas samples were collected in 1-liter stainless steel SummaTM canisters provided by the laboratory. The laboratory certified that the canisters had been properly cleaned and evacuated prior to shipment. Each canister was used within 30 days of receipt from the laboratory. A dedicated sampling train, consisting of a mechanical vacuum gauge and flow regulator, was provided by the lab and connected directly to the SummaTM canister. The pressure inside the stainless steel canister was measured prior to sampling to confirm that the canister arrived from the laboratory with the laboratory-recommended minimum vacuum of -25 inches of mercury. Initial canister vacuum readings were noted on the Soil Vapor Sampling Forms. The dedicated sampling train attached to the SummaTM canister was connected to a tee and valve that was used to isolate the dedicated SummaTM canister and sampling train from the common components of the sampling system. These common components of the sampling system included a sampling manifold, bleed valve, LFG monitor, and

⁵ ADEQ (2011) defines *internal volume* as the *dead volume* plus probe tip sand-pack volume. The dead volume is defined as the volume of the sampling probe and the connected sampling tubing.

vacuum pump. The sampling manifold consisted of a valve, mechanical vacuum gauge, and flow meter.. Photographs and a schematic diagram of the sampling system are included in the Attachment E2.

The valve to the sampling manifold was closed prior to the collection of the sample, and the valve on the Summa™ canister was opened to allow the soil gas to flow into the canister. In accordance with ADEQ guidance (2011), the samples were collected at the default flow rate of 200 ml/min or less. The sample collection flow rate was managed by the dedicated flow regulator in the sample train provided by the laboratory. The pressure inside the Summa™ canister was measured and documented after sampling was complete.

Leak testing was conducted as soil gas samples were collected. A leak detection compound, 2-propanol (a.k.a. rubbing alcohol), was used to saturate the air space around the sampling train by applying it to a towel and placing it around the sampling train connections. To confirm that the sampling train and probe surface seal were tight, samples were analyzed for the leak test compound. If the concentration of 2-propanol was greater than or equal to 10 micrograms per liter (µg/L), the results were discussed with the ADEQ Project Manager, and the usability of the data were evaluated during data validation. The 10 µg/L leak detection threshold concentration for 2-propanol was based on procedures used at similar sites in Arizona.

Duplicate samples were collected for Quality Assurance/Quality Control (QA/QC) purposes in accordance with the procedures described in Appendix B of the RI Work Plan (Clear Creek, 2013). The total number of duplicate soil gas samples collected from the probes during this LOU RI investigation in February and March of 2013 was approximately ten percent of the total number of samples. A minimum of one duplicate sample was collected from each sample delivery group sent to the lab.

The Summa™ canisters containing soil gas samples were shipped to the ESC Lab Sciences, Inc. (ESC) for analysis. Sample shipments were accompanied by a chain-of-custody record. Self-adhesive custody seals were placed across the lid of each box that was shipped to the lab.

3.4.3 Analyses

Samples were submitted to ESC Lab Sciences for analysis of VOCs according to the RI Work Plan (Clear Creek, 2013). ESC analyzed the soil gas samples for tetrachloroethylene (PCE), trichloroethylene (TCE), vinyl chloride (VC), and other VOCs (including the leak detection compound, 2-propanol) by Environmental Protection Agency (EPA) Method TO-15.

4.0 SUMMARY OF INVESTIGATION RESULTS

4.1 LANDFILL GAS

The 2013 concentrations of LFG measured prior to sample collection are provided in Tables E1 and E2. Tables summarizing recent and historical concentrations of LFG are provided in Attachments E3.2 and E3.4. Plots of carbon dioxide, oxygen, and methane versus time for the deep-nested soil gas probes are provided in Attachments E3.1 and E3.3.

4.1.1 Oxygen

At BNL, oxygen concentrations ranged from 0.0% to 22.1%. In general, at BNL, oxygen concentrations were consistent with, or lower, than previous measurements. Where oxygen concentrations declined, there was generally a similar increase in the carbon dioxide concentration (Attachment E3.1).

At BSL, oxygen concentrations ranged from 0.0% to 19.1%. Oxygen concentrations have dropped at BSL since the 2006 soil gas monitoring events, as shown on the plots in Attachment E3.3.

4.1.2 Methane

At BNL, methane concentrations ranged from 0.0% to 18.9% during the 2013 monitoring event. The highest concentration was measured at R-070A at a depth of 50 feet. This probe is located in the middle of the northern cell at BNL (Figure E3).

At BSL, methane concentrations ranged from 0.0% to 11.1%. The maximum concentration was measured in BSDP-1 at a depth of 100 feet (Figure E4). Methane concentrations at BSL in 2013 are generally higher than the sampling event in May 2006, and consistent with levels measured in October 2006 (Attachment E3.3).

4.1.3 Carbon Dioxide

At BNL, carbon dioxide concentrations ranged from 0.0% to 24.5%. Carbon dioxide concentrations at BNL generally show an inverse relationship with the oxygen concentrations. As oxygen levels have dropped, carbon dioxide concentrations generally have risen by a similar amount (Attachment E3.1). These trends are consistent with consumption of oxygen by aerobic biodegradation activity following removal of COCs by the SVE/AI system at BNL.

At BSL, carbon dioxide concentrations ranged from 1.9% to 19.4%. Carbon dioxide concentrations at BSL in 2013 are generally consistent with the October 2006 monitoring event (Attachment E3.3).

4.2 VOCS

4.2.1 BNL

Seventy-four samples were collected from deep-nested soil gas probes at BNL, including seven blind duplicates. A list of parameters analyzed, along with the analytical results, is presented in Table E3. The maximum concentrations, the equivalent soil concentrations (calculated according to ADEQ, 2011), SRLs, and minimum GPLs are presented at the end of Table E3. A detection summary is presented on Table E4. A statistical analysis is provided on Table E5. The 2013 maximum and average analytical results at BNL compare favorably with those reported by Stantec (2008) as summarized below:

Analyte	2013 Maximum/Average (mg/m ³) From Table E5	2008 Maximum/Average (mg/m ³) (Stantec, 2008)
cis-1,2-DCE	3.7 / 0.261	5.1 / 0.35
Methylene chloride	0.094 / 0.021	0.35 / 0.040
PCE	2.2 / 0.312	15 / 0.9
TCE	0.75 / 0.065	1.6 / 0.15
VC	0.31 / 0.036	0.87 / 0.083

Note: mg/m³ – milligrams per meter cubed.

Averages for 2013 were conservatively calculated using the reporting limit if the constituent was not detected above the reporting limit. Field duplicate samples were not included in the calculations. Results from DP-2 and DP-3 probes were not included in the calculations due to probe obstructions.

On Table E3, the soil equivalent concentration of the maximum soil gas concentration can be compared with the most stringent SRL and with the minimum GPL, if one has been established. None of the soil equivalent concentrations exceeded either level.

Historical analytical results and plots (Attachment E4) indicate that VOC concentrations in the vadose zone at BNL are decreasing. There does not appear to be appreciable rebound since SVE/AI operations were discontinued in 2002. A discussion of specific compounds is provided below.

4.2.1.1 PCE

PCE was detected at BNL in 61 of the 74 samples at concentrations above the laboratory reporting limits. The average detected concentration⁶ of PCE was 0.312 mg/m³ (Table E5). The highest PCE concentration was 2.2 mg/m³ (or µg/L) in WR-273A from a depth of 220 feet. This probe had the highest PCE concentration during the fifth rebound monitoring in 2008 when the concentration of was 15 mg/m³. The maximum PCE concentration in the first rebound test (December 2002) was 1.898 mg/m³ (at R-072 WH) But in the third through the fifth rebound tests, maximum PCE concentrations ranged from approximately 7.5 to 15 mg/m³. Based on the 2013 results, there does not appear to be appreciable rebound of vapor phase PCE in the vadose zone below the BNL. Plots of historic PCE concentrations are included on Figure E5 and in Attachment E4.1. Further discussion regarding the SVE rebound testing and the extent of VOCs in the vadose zone is included in Sections 3.3.3 and 4.5 of the RI report.

Using the dimensionless Henry's Law constant, the soil equivalent concentration of the highest soil gas PCE concentration is 0.00342 milligrams per kilogram (mg/kg). This is less than the minimum GPL of 0.80 mg/kg and the most stringent SRL of 0.51 mg/kg.

Plots of PCE concentrations versus time at BNL and tables of historic VOC concentrations are provided in Attachment E4.

4.2.1.2 Methylene Chloride

Methylene chloride was detected at BNL in 39 of the 74 samples at concentrations above the laboratory reporting limits. The maximum concentration of 0.094 mg/m³ was detected in the sample collected from the wellhead of WR-070A (Table E5). This maximum concentration was below the 2008 maximum concentration of 0.35 mg/m³. The average methylene chloride concentration detected at BNL in 2013 was 0.021 mg/m³; this is below the average concentration of 0.040 mg/m³ in 2008. This comparison suggests that there is no appreciable rebound of vapor phase methylene chloride in the vadose zone below the BNL.

⁶ Average concentrations of the analytes discussed were conservatively calculated by using the reporting limit if the compound was not detected. Field duplicates were not included in the statistical calculations.

Using the dimensionless Henry's Law constant, the soil equivalent concentration of the highest soil gas methylene chloride concentration is 0.00020 mg/kg. This is below the most stringent SRL of 9.3 mg/kg. ADEQ has not set a minimum GPL for methylene chloride.

4.2.1.3 TCE

TCE was detected at BNL in 42 of the 74 deep-nested soil gas probe samples at concentrations above the laboratory reporting limits. The average detected concentration of TCE was 0.065 mg/m³ (Table E5). The highest TCE concentration was 0.75 mg/m³ in DP-7 from a depth of 300 feet. In 2008, the highest TCE concentration was 1.6 mg/m³, and the average concentration was 0.15 mg/m³. The statistical data suggest that there is no appreciable rebound of vapor phase TCE concentrations in the vadose zone below the BNL.

Using the dimensionless Henry's Law constant, the soil equivalent concentration of the highest soil gas TCE concentration is 0.00209 mg/kg. This soil equivalent is less than the minimum GPL of 0.76 mg/kg and the most stringent SRL of 3.0 mg/kg.

4.2.1.4 Cis-1,2-DCE

Cis-1,2-DCE was detected at BNL in 40 of the 74 samples at concentrations above the laboratory reporting limits. The average detected concentration of cis-1,2-DCE was 0.261 mg/m³ (Table E5). The highest cis-1,2-DCE concentration was 3.7 mg/m³ in R-069A from a depth of 50 feet. In 2008, the highest cis-1,2-DCE concentration was 5.1 mg/m³, and the average concentration was 0.35 mg/m³. The statistical data indicate that there is no appreciable rebound of vapor phase cis-1,2-DCE in the vadose zone below the BNL.

Using the dimensionless Henry's Law constant, the soil equivalent concentration of the highest soil gas cis-1,2-DCE concentration is 0.00763 mg/kg. This is below the minimum GPL of 5.3 mg/kg and the most stringent SRL of 43 mg/kg.

4.2.1.5 Vinyl Chloride

VC was detected at BNL in 30 of the 74 samples at concentrations above the laboratory reporting limits. The average detected concentration of VC was 0.036 mg/m³ (Table E5). The highest VC concentration was 0.31 mg/m³ in R-069A from a depth of 100 feet. In 2008, the highest VC concentration was 0.87 mg/m³, and the average concentration was 0.083 mg/m³. The statistical data indicate that there is no appreciable rebound of vapor phase VC concentrations in the vadose zone below the BNL.

Using the dimensionless Henry's Law constant, the soil equivalent concentration of the highest soil gas VC concentration is 0.00012 mg/kg. This soil equivalent concentration is less than the most stringent SRL of 0.085 mg/kg. ADEQ has not set a minimum GPL for VC.

4.2.2 Broadway South Landfill

4.2.2.1 PCE

PCE was detected at BSL in 27 of 27 samples at concentrations above the laboratory reporting limits. The average detected concentration of PCE was 3.87 mg/m³ (Table E8). The highest PCE concentration was 18 mg/m³ (or µg/L) in BP-23 from a depth of 250 feet.

Using the dimensionless Henry's Law constant the soil equivalent concentration of the highest soil gas PCE concentration is 0.02795 mg/kg. This is below the minimum GPL of 0.80 mg/kg and the most stringent SRL of 0.51 mg/kg.

Tables of historic VOC concentrations at BSL and plots of PCE concentrations versus time are provided in Attachment E4 and on Figure E6. Recent VOC concentrations in soil gas from several depths and locations are higher than those measured during the previous monitoring event in May and October of 2006.

4.2.2.2 Methylene Chloride

Methylene chloride was detected at BSL in 20 of the 27 samples at concentrations above the laboratory reporting limits. The maximum concentration of 0.73 mg/m³ was detected in the sample collected from BSDP-1 at a depth of 150 feet. The average methylene chloride concentration detected at BSL in 2013 was 0.15 mg/m³.

Using the dimensionless Henry's Law constant the soil equivalent concentration of the highest soil gas methylene concentration is 0.00152 mg/kg. This is below the most stringent SRL of 9.3 mg/kg. ADEQ has not set a minimum GPL for methylene chloride.

4.2.2.3 TCE

TCE was detected at BSL in 24 of the 27 samples at concentrations above the laboratory reporting limits. The average detected concentration of TCE was 0.90 mg/m³ (Table E8). The highest TCE concentration was 2.4 mg/m³ in BSDP-1 from a depth of 150 feet. As is the case with PCE, there appears to be a slight upward trend in vapor phase TCE concentrations, but the trend is not consistent throughout the site.

Using the dimensionless Henry's Law constant, the soil equivalent concentration of the highest soil gas TCE concentration is 0.00668 mg/kg. This is below the minimum GPL of 0.76 mg/kg and the most stringent SRL of 3.0 mg/kg.

4.2.2.4 *Cis-1,2-DCE*

Cis-1,2-DCE was detected at BSL in 19 of the 27 samples at concentrations above the laboratory reporting limits. The average detected concentration of cis-1,2-DCE was 0.29 mg/m³ (Table E8). The highest cis-1,2-DCE concentration was 1.6 mg/m³ in WR-434A from a depth of 250 feet. Concentrations of vapor phase cis-1,2-DCE appear to be increasing, but this trend is not consistent throughout the site.

Using the dimensionless Henry's Law constant, the soil equivalent concentration of the highest soil gas cis-1,2-DCE concentration is 0.00330 mg/kg. This is below the minimum GPL of 5.3 mg/kg and the most stringent SRL of 43 mg/kg.

4.2.2.5 *Vinyl Chloride*

VC was detected at BSL in 7 of the 27 samples at concentrations above the laboratory reporting limits. The average detected concentration of VC was 0.02 mg/m³ (Table E8). The highest VC concentration was 0.028 mg/m³ in BP-23 from a depth of 250 feet. Although it is difficult to ascertain trends in the vapor phase VC concentrations based on the three rounds of data available, in 2013 VC was detected for the first time in a few of the probes, including BSDP-1-100, BSDP-4-50, and BP-23-250.

Using the dimensionless Henry's Law constant, the soil equivalent concentration of the highest soil gas VC concentration is 0.00001 mg/kg. This is below the most stringent SRL of 0.085 mg/kg. ADEQ has not set a minimum GPL for VC.

5.0 RESULTS OF DATA VALIDATION

Clear Creek contracted Innovative Technical Solutions, Inc. (ITSI) to conduct data validation according to USEPA guidance (USEPA, 2008) and according to the Quality Assurance Project Plan in the RI Work Plan (Clear Creek, 2013). The data validation included review of reports from the laboratory equivalent to EPA Level III data deliverables, which include sample results, chain-of-custody forms, basic quality control summaries including surrogate recoveries, method blank results, and precision and accuracy data summaries for the sample preparation batch. Fourteen soil gas samples of the 150 soil gas samples collected by Clear Creek for the LOU RI underwent full data validation for which the laboratory provided a level IV data deliverable. Full data validation included all of the items listed above plus a review of the data for instrument calibrations, sample quantitation, compound identification and internal standard recoveries and raw data.

The laboratory reports and chain-of-custody documentation are in Appendix H of this RI report. The Data Validation report is in Appendix I.

Relevant data validation results for the deep soil gas probe analyses are:

- Field staff noted moisture in the sampling train during collection of samples from WR-434A (all depths), BSDP-2 (100 ft), BSDP-4 (50, 100, and 150 ft), BP-23 (200, 250, 300 ft), DP-7 (50, 100, 150, 250, and 300 ft), WR-273A (50, 135, 135 duplicate, and 220 ft), and R-074A (50 and 100 ft). Because VOCs can partition out into water, a low bias was introduced into these samples. The associated results have been qualified as “J-“ or “UJ-“ for an estimated value or reporting limit with a low bias due to poor sample integrity. The data validator considered the results useable as flagged, because the moisture was an unavoidable and unpredictable condition in the field environment.
- The field duplicate sample BSDP-02-2500 (which is a duplicate of the sample from BSDP-02 from 250 feet) had an insufficient initial vacuum pressure (-16 inches of mercury). The field duplicate results were rejected due to poor sample integrity. The results from this sample should not be used to determine precision of the sampling procedure. Other data are considered useable as qualified.
- The leak detection compound, 2-propanol, was detected at 5,400 parts per billion by volume (ppbv) in sample DP-7-250. The results have been qualified as “UJ-” for an estimated reporting limit with a low bias. The remaining samples were within the criteria for 2-propanol.
- The laboratory control sample duplicate percent recoveries for 1,2-dichloroethane and trichlorofluoromethane were out of criteria for the batch including WR-434A-150, WR-434A-

250, and WR-434A-350. The associated results have been qualified as “J-” or “UJ-” for an estimated value or reporting limit with a low bias.

- The relative percent difference between the laboratory control sample and the laboratory control sample duplicate for 1,2-dichloroethane, trans-1,3-dichloropropene, and trichlorofluoromethane were out of criteria for the batch including WR-434A-150, WR-434A-250, and WR-434A-350. The associated positive results in this batch for trichlorofluoromethane were qualified with a “J”. Non-detect results did not require an additional qualifier.
- The laboratory control sample duplicate percent recovery was out of criteria for dichlorodifluoromethane for the batch including the following samples: DP-4-100, DP-5-150, DP-5-100, DP-2-200, DP-2-50, and DP-7-150. Associated results have been qualified as “J-” for an estimated value with a low bias.
- The laboratory control sample duplicate percent recovery was out of criteria for 1,2,4-trichlorobenzene and hexachlorobutadiene for the batch R-070A-WH (the sample collected from the wellhead) and WR-274A-50. Associated results have been qualified as “UJ-” for an estimated value with a low bias.
- The field duplicate relative percent difference for 1,4-dichlorobenzene was out of criteria in the field duplicate pair DP-4-50/DP-4-500. The associated results in the field duplicate and parent sample have been qualified with a “J” for an estimated value.
- The field duplicate relative percent difference for methylene chloride was out of criteria in the field duplicate pair R-072A-50/R-072A-500. The associated results in the field duplicate and parent sample have been qualified with a “J” for an estimated value.

The data, as qualified, are useable for their intended purposes, as listed in Section 1.0.

6.0 SUMMARY

Clear Creek collected soil gas samples from deep-nested soil vapor probes at BNL and BSL between February 21, 2013 and March 15, 2013. A total of 74 soil gas samples were collected from BNL probes (including 7 blind field duplicates) and 27 soil gas samples were collected from BSL probes (including 2 blind duplicates). LFG concentrations were measured during purging. The samples were submitted to ESC Lab Sciences for analysis of VOCs by EPA Method TO-15.

Significant findings are:

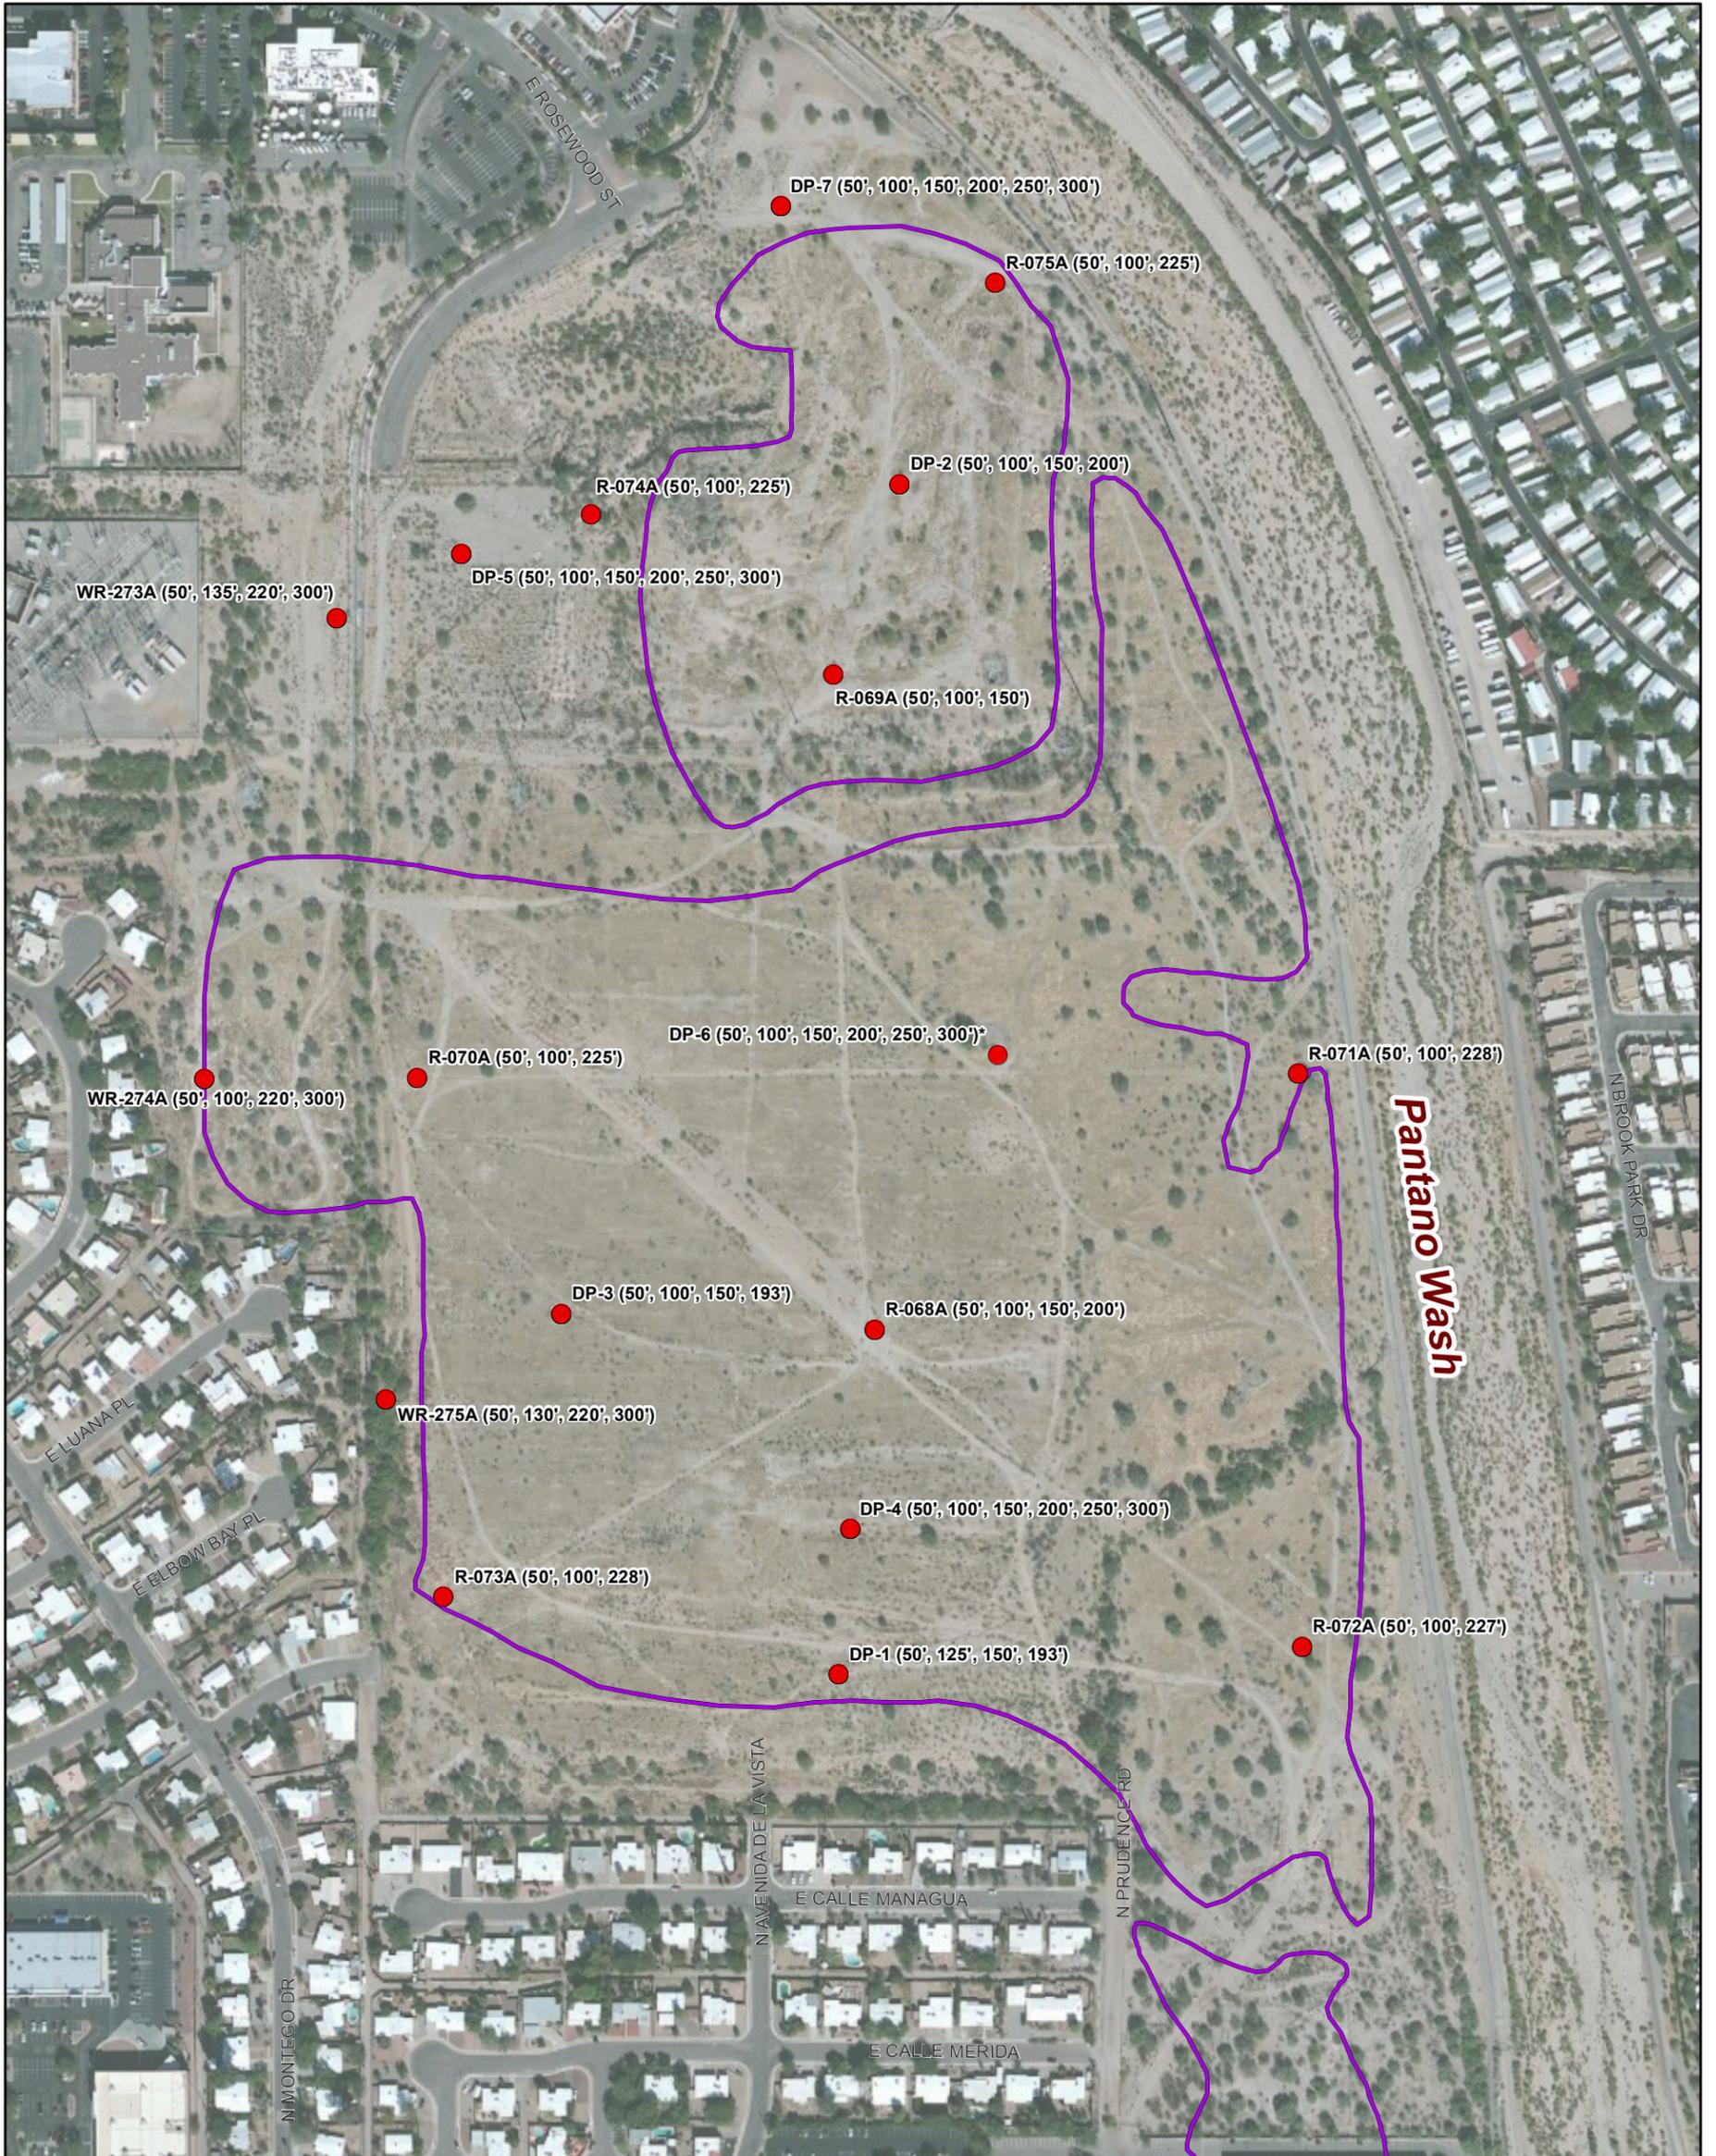

- After converting soil gas concentrations to soil equivalent concentrations, no soil equivalent concentration exceeded an SRL or a GPL.
- VOC concentrations in the vadose zone at BNL are decreasing. There does not appear to be appreciable rebound since SVE/AI operations were discontinued in 2002.
- PCE concentrations appear to be gradually increasing at BSL. However, a clear trend is difficult to discern due to the small number of monitoring events (three) and possible differences in sample collection methodology⁷. Similar increases in methylene chloride and TCE also occurred at BSL, but definitive trends are not obvious, based on the three rounds of monitoring that have been conducted at the site.
- LFG concentrations at BNL were generally consistent with historical results. At some locations, oxygen concentrations continued to decline at BNL. These incidents were usually accompanied by a similar rise in carbon dioxide concentrations.
- Oxygen concentrations at BSL have declined since monitoring began in 2006. Carbon dioxide and methane concentrations are generally consistent with previous results.

⁷ Previous monitoring was conducted prior to issuance of ADEQ's Soil Vapor Sampling Guidance (2011).

Notes:

NA - not analyzed

WH - wellhead

% - percentage by volume measured during soil gas purge

Sample ID (WR-273A-50) = probe ID (WR-273A) dash sample depth (typically the bottom of the screen interval; 50 feet below land surface).

* An April 2014 field check of soil gas probe depths revealed blockages in DP-2 and DP-3 probes at depths of 6 and 20 feet, respectively (ADEQ, 2014). Because it is uncertain when this damage occurred, data from DP-2 and DP-3 were not used to draw conclusions for the Final LOU RI Report.

** The measured depths for the DP-1-150' and DP-1-193' soil gas probes were 191.45' bls and 153.95' bls respectively; ADEQ is surmising that the probes were mislabeled from the beginning. All tables and figures in this report have been revised so that the sample ID reflects the proper probe depth.

*** Sample was collected from the 1-inch diameter probe is actually screened at a depth of 300 feet bls.

**** Sample was collected from the 5-inch diameter well screened at approximately 300 feet bls.

Notes:

NA - not analyzed

% - percentage by volume measured during soil gas purge

Sample ID (BSDP-3-50) = probe ID (BSDP-3) dash sample depth (typically the bottom of the screen interval; 50 feet below land surface).

Notes:
mg/m³ milligrams per cubic meter
mg/kg milligrams per kilogram
DUP Duplicate sample
NA Not applicable
ND Analyte not detected above reporting limit
NS Not sampled

UNK Depth unknown
WH Wellhead
SRL Soil Remediation Level
GPL Groundwater Protection Level
Qual Qualifier
Shaded cell indicates detection

Notes continued:
1 Sample ID (WR-273A-50) = probe ID (WR-273A) dash sample depth (typically the bottom of the screen interval; 50 feet below land surface).
2 Calculated according to ADEQ (2011) guidance. Constants for chemical properties were obtained from USEPA (2013) if not provided by ADEQ (2011). Soil equivalents were not calculated if constants were not provided by ADEQ (2011) or USEPA (2013). Data from DP-2 and DP-3 were not used as maximum concentrations due to obstructions (see note 7).
3 Soil Remediation Levels, Arizona Administrative Code Title 18, Article 2, Effective as May 5, 2007- http://www.azsos.gov/public_services/title_18/18-07.htm.
4 Groundwater Protection Levels, Arizona Department of Environmental Quality, A Screening Method to Determine Soil Concentrations Protective of Groundwater Quality, September 1996, VOCs revised 2008.
5 2-Propanol was used as the leak detection compound.
6 The measured depths for DP-1-150' and DP-1-193' soil gas probes were 191.45' bls and 153.95' bls respectively; ADEQ surmises that the probes were mislabeled from the beginning. Tables and figures in this report have been revised so that the sample ID reflects the proper probe depth.
7 An April 2014 field check revealed blockages of DP-2 and DP-3 probes at depths of 6 and 20 feet, respectively. Because it is uncertain when damage occurred, data from these probes were not used to draw conclusions for the Final LOU RI Report.
8 Sample was collected from the 1-inch diameter probe is screened at a depth of 300 feet bls, properly referred to as WR-274A-300.
9 Sample was collected from the 5-inch wellhead screened at approximately 300 feet bls at WR-274A.
* Indicates SRL is based on the chemical-specific saturation level in soil for volatile organic chemicals only.
** Based on SRL for CAS 542-75-6.
*** Indicates GPL based upon saturation limit.

Notes:
mg/m³ milligrams per cubic meter
mg/kg milligrams per kilogram
DUP Duplicate sample
NA Not applicable
ND Analyte not detected above reporting limit
NS Not sampled

UNK Depth unknown
WH Wellhead
SRL Soil Remediation Level
GPL Groundwater Protection Level
Qual Qualifier
Shaded cell indicates detection

There may be a slight discrepancy between the reported value in the laboratory report and the reported value in the data validator's report due to a conversion of units (from parts per billion to mg/m³). These values are very small and do not result in any substantive difference relative to SRLs.

Notes continued:

- Sample ID (WR-273A-50) = probe ID (WR-273A) dash sample depth (typically the bottom of the screen interval; 50 feet below land surface).
- Calculated according to ADEQ (2011) guidance. Constants for chemical properties were obtained from USEPA (2013) if not provided by ADEQ (2011). Soil equivalents were not calculated if constants were not provided by ADEQ (2011) or USEPA (2013). Data from DP-2 and DP-3 were not used as maximum concentrations due to obstructions (see note 7).
- Soil Remediation Levels, Arizona Administrative Code Title 18, Article 2, Effective as May 5, 2007 - http://www.azsos.gov/public_services/title_18/18-07.htm.
- Groundwater Protection Levels, Arizona Department of Environmental Quality, A Screening Method to Determine Soil Concentrations Protective of Groundwater Quality, September 1996, VOCs revised 2008.
- 2-Propanol was used as the leak detection compound.
- The measured depths for DP-1-150' and DP-1-193' soil gas probes were 191.45' bls and 153.95' bls respectively; ADEQ surmises that the probes were mislabeled from the beginning. Tables and figures in this report have been revised so that the sample ID reflects the proper probe depth.
- An April 2014 field check revealed blockages of DP-2 and DP-3 probes at depths of 6 and 20 feet, respectively. Because it is uncertain when damage occurred, data from these probes were not used to draw conclusions for the Final LOU RI Report.
- Sample was collected from the 1-inch diameter probe is screened at a depth of 300 feet bls, properly referred to as WR-274A-300.
- Sample was collected from the 5-inch wellhead screened at approximately 300 feet bls at WR-274A.
- Indicates SRL is based on the chemical-specific saturation level in soil for volatile organic chemicals only.
- Based on SRL for CAS 542-75-6.
- Indicates GPL based upon saturation limit.

Qualifiers:

- J Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
- U Undetected: The analyte was analyzed for, but not detected.
- UJ The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
- B (EPA) - The indicated compound was found in the associated method blank as well as the laboratory sample.
- B3 (ESC) - The indicated compound was found in the associated method blank, but all reported samples were non-detect.
- (-) Indicates a low bias.
- (+) Indicates a high bias.
- < Less than laboratory reporting limit.

Vinyl chloride	mg/m ³	0.26	0.17	<0.00102	0.0028	0.31	60	0.31	0.036	0.067

Notes:

mg/m³ milligrams per cubic meter

< Less than the Reporting Limit

Std. Dev. Standard Deviation for this sampling event

Max Maximum concentration detected in this sampling event

Avg Average concentration detected in this sampling event

Shaded cell indicates maximum concentration detected in this sampling event

Bold Value Concentration above laboratory reporting limit

Sample ID (DP-7-300) = probe ID (DP-7) dash sample depth (typically the bottom of the screen interval; 300 feet below land surface).

Note: The average and standard deviation are conservatively calculated using the reporting limit if the constituent was not detected above the reporting limit. Field duplicate samples were not included in the calculations. Results from DP-2 and DP-3 probes were not included in the calculations due to probe obstructions.

Notes:
mg/m³ milligrams per meter cubed
mg/kg milligrams per kilogram
DUP Duplicate sample
NA Not applicable
ND Analyte not detected above reporting limit
NS Not sampled
UNK Depth unknown
WH Wellhead
SRL Soil Remediation Level
GPL Groundwater Protection Level
Qual Qualifier
Shaded cell indicates detection

Notes continued:
1 Sample ID (BSDP-3-50) = probe ID (BSDP-3) dash sample depth (typically the bottom of the screen interval; 50 feet below land surface).
2 Calculated according to ADEQ (2011) guidance. Constants for chemical properties were obtained from USEPA (2013) if not provided by ADEQ (2011). Soil equivalents were not calculated if constants were not provided by ADEQ (2011) or USEPA (2013).
3 Soil Remediation Levels, Arizona Administrative Code Title 18, Article 2, Effective as May 5, 2007- http://www.azsos.gov/public_services/title_18/18-07.htm.
4 Groundwater Protection Levels, Arizona Department of Environmental Quality, A Screening Method to Determine Soil Concentrations Protective of Groundwater Quality, September 1996, VOCs revised 2008.
5 2-Propanol was used as the leak detection compound.
* Indicates SRL is based on the chemical-specific saturation level in soil for volatile organic chemicals only.
** Based on SRL for CAS 542-75-6.
*** Indicates GPL based upon saturation limit.
Qualifiers:
J Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
U Undetected: The analyte was analyzed for, but not detected.
UJ The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
B (EPA) - The indicated compound was found in the associated method blank as well as the laboratory sample.
B3 (ESC) - The indicated compound was found in the associated method blank, but all reported samples were non-detect.
(-) Indicates a low bias.
(+) Indicates a high bias.
< Less than laboratory reporting limit.

There may be a slight discrepancy between the reported value in the laboratory report and the reported value in the data validator's report due to a conversion of units (from parts per billion to mg/m³). These values are very small and do not result in any substantive difference relative to SRLs.

**Table E7
Detection Summary - Deep-Nested Soil Gas Probes
Broadway South Landfill 2013**

Compound	Samples Analyzed	Number of detections > RL	Feb-Mar 2013 Maximum Concentration (mg/m ³)	Feb-Mar 2013 Location of Maximum Concentration

Notes:

mg/m³ - milligrams per cubic meter

ND - not detected above reporting limit

RL laboratory reporting limits

Sample ID (BP-23-300) = probe ID (BP-23) dash sample depth (typically the bottom of the screen interval; 300 feet below land surface).

Table E8
Statistical Summary - Chemicals of Concern
Broadway South Landfill 2013

Samples Collected February-March 2013		Sample ID			Statistical Analysis			
Constituent	Units	WR-434A-B 250	BSDP-1-150	BP-23-250	Sample Count	Max	Average	Std. Dev.
cis-1,2-Dichloroethene	mg/m ³	1.6	0.59	0.067	25	1.6	0.29	0.36
Methylene Chloride	mg/m ³	0.073	0.73	0.097	25	0.73	0.15	0.20
Tetrachloroethylene (PCE)	mg/m ³	4.1	5.2	18	25	18	3.87	4.32
Trichloroethylene (TCE)	mg/m ³	1.2	2.4	1.7	25	2.4	0.90	0.75
Vinyl chloride	mg/m ³	<0.0102	<0.0128	0.028	25	0.028	0.02	0.03

Notes:

mg/m³ milligrams per cubic meter

< Less than the reporting limit

Std. Dev. Standard Deviation for this sampling event

Max Maximum concentration detected in this sampling event

Shaded Cell indicates maximum concentration detected in this sampling event

Bold Value Concentration above laboratory reporting limit

Sample ID (BP-23-250) = probe ID (BP-23) dash sample depth (typically the bottom of the screen interval; 250 feet below land surface).

Note: The average and standard deviation are conservatively calculated using the reporting limit if the constituent was not detected above the reporting limit. Field duplicate samples were not included in the calculations.

Note, this 5-inch diameter well is screened from approximately 318 to 365 feet bls according to well construction diagrams. It is screened within the same filter pack interval as the 1 inch diameter probe of the same name. This probe has been called WR-274A-WH in previous investigations.

Notes: Attach 1/2" tubing to diversion valve off well casing

Notes:

NA - Not Analyzed

WH - Wellhead

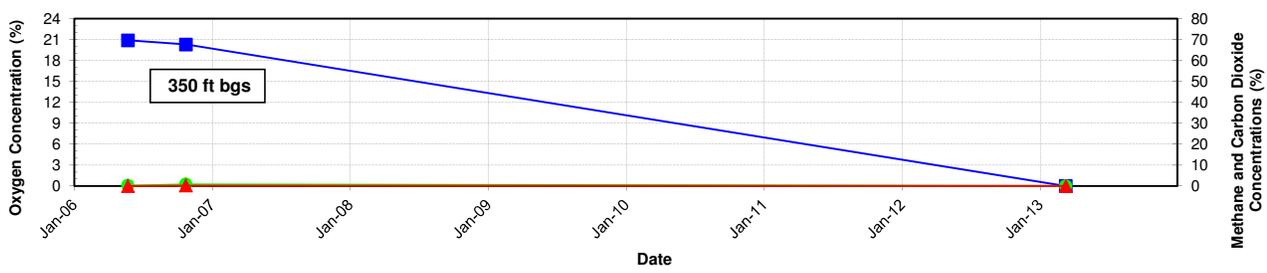

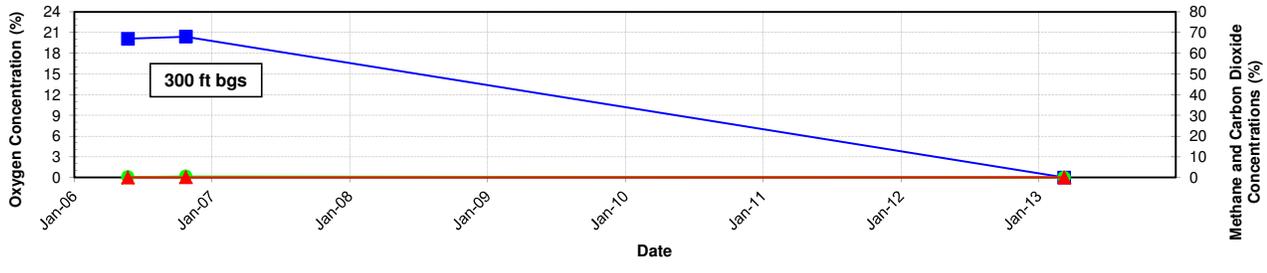

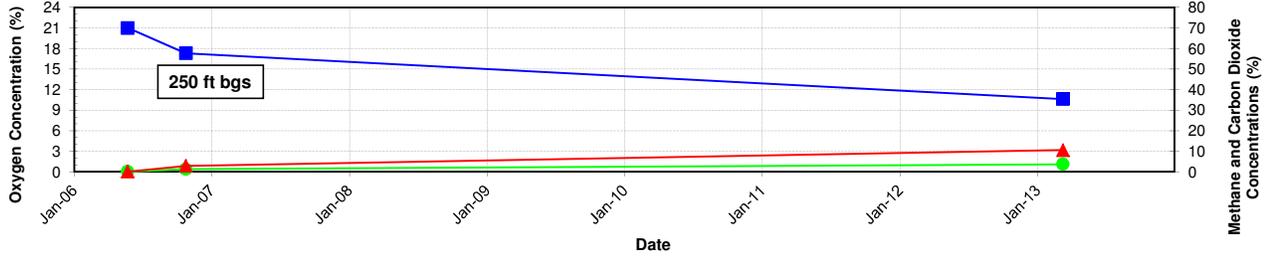

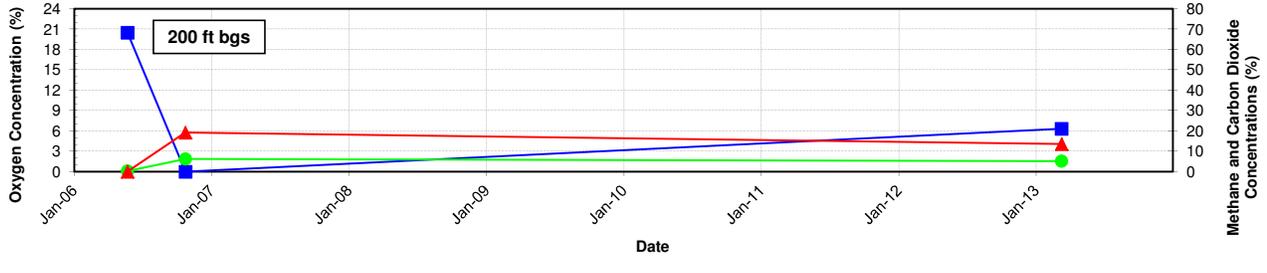

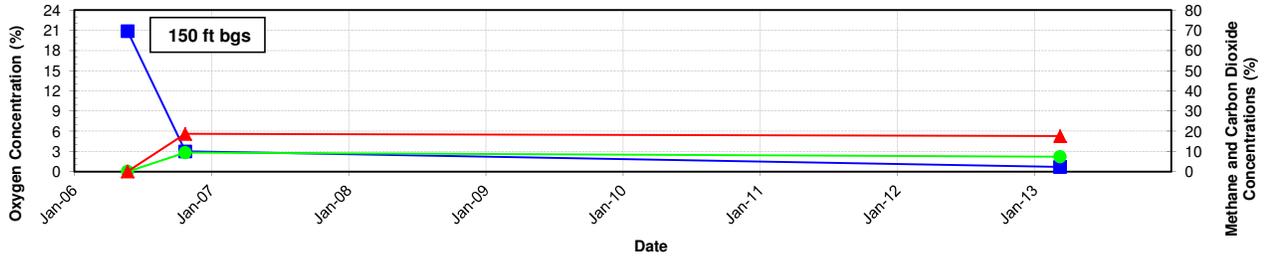

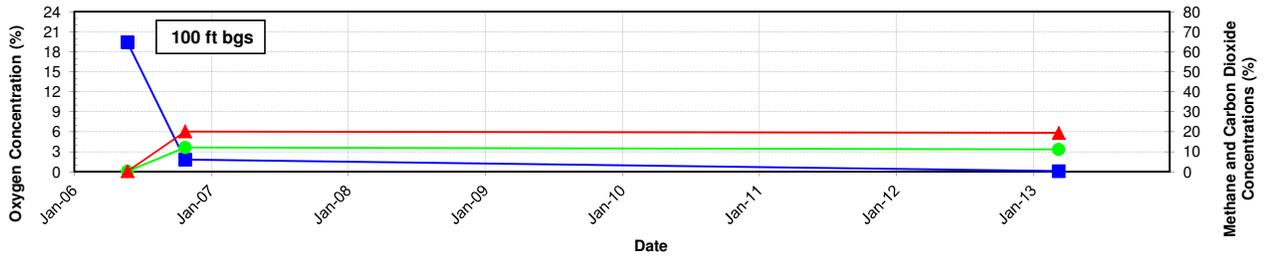

% - percentage by volume measured during soil gas purge

Sample ID (WR-275A-50) = probe ID (WR-275A) dash sample depth (typically the bottom of the screen interval; 50 feet below land surface).

* An April 2014 field check of soil gas probe depths revealed blockages in DP-2 and DP-3 probes at depths of 6 and 20 feet, respectively (ADEQ, 2014). Because it is uncertain when this damage occurred, data from DP-2 and DP-3 were not used to draw conclusions for the Final LOU RI.

**The measured depths for the probes DP1-150 and DP-1-193 were 191.45 feet and 153.95 feet bls respectively. ADEQ surmises that the probes were mislabeled from the beginning. Tables and Figures in this report have been revised so that the sample ID reflects the proper probe depth.

Notes:

NA - Not Analyzed

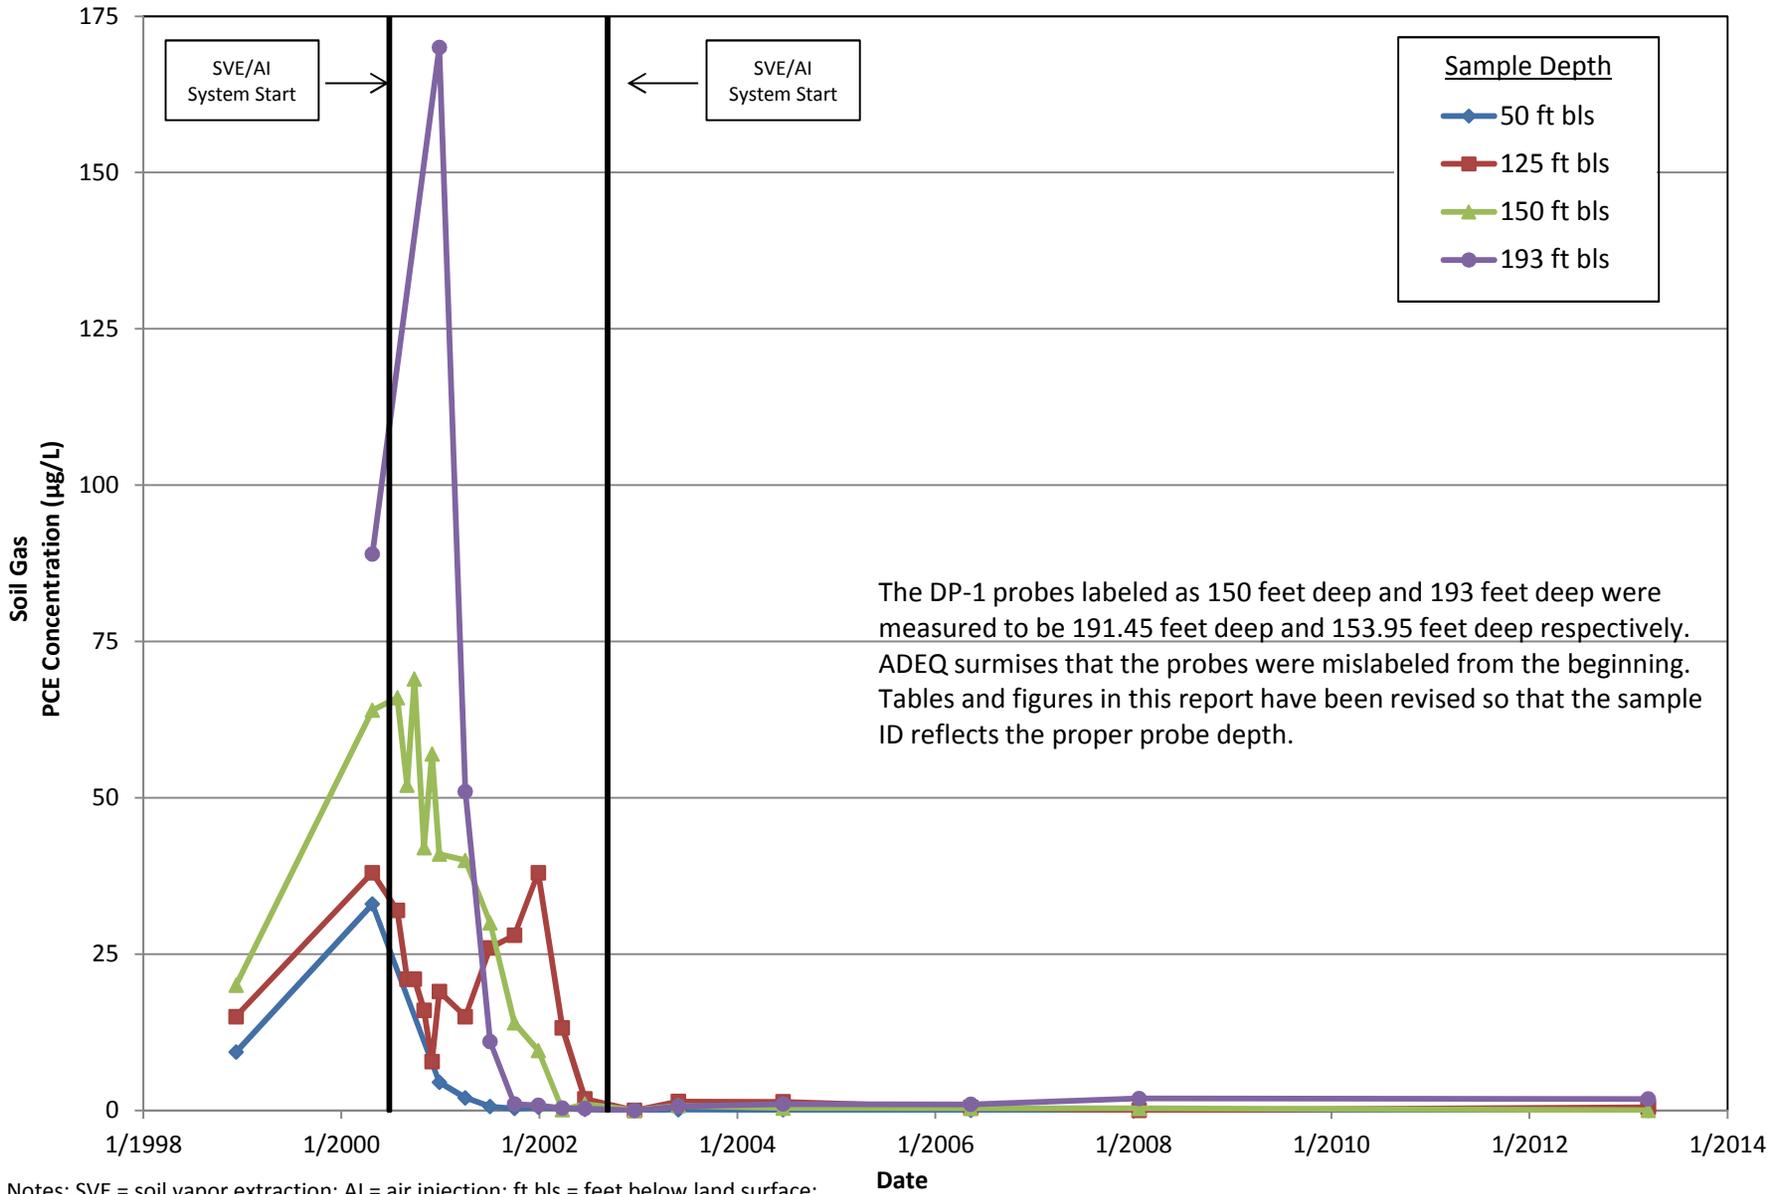

% - percentage by volume measured during soil gas purge

Sample ID (BP-23-350) = probe ID (BP-23) dash sample depth (typically the bottom of the screen interval; 350 feet below land surface).

BROADWAY NORTH LANDFILL
HISTORICAL SOIL GAS CONCENTRATIONS PCE PLOTS

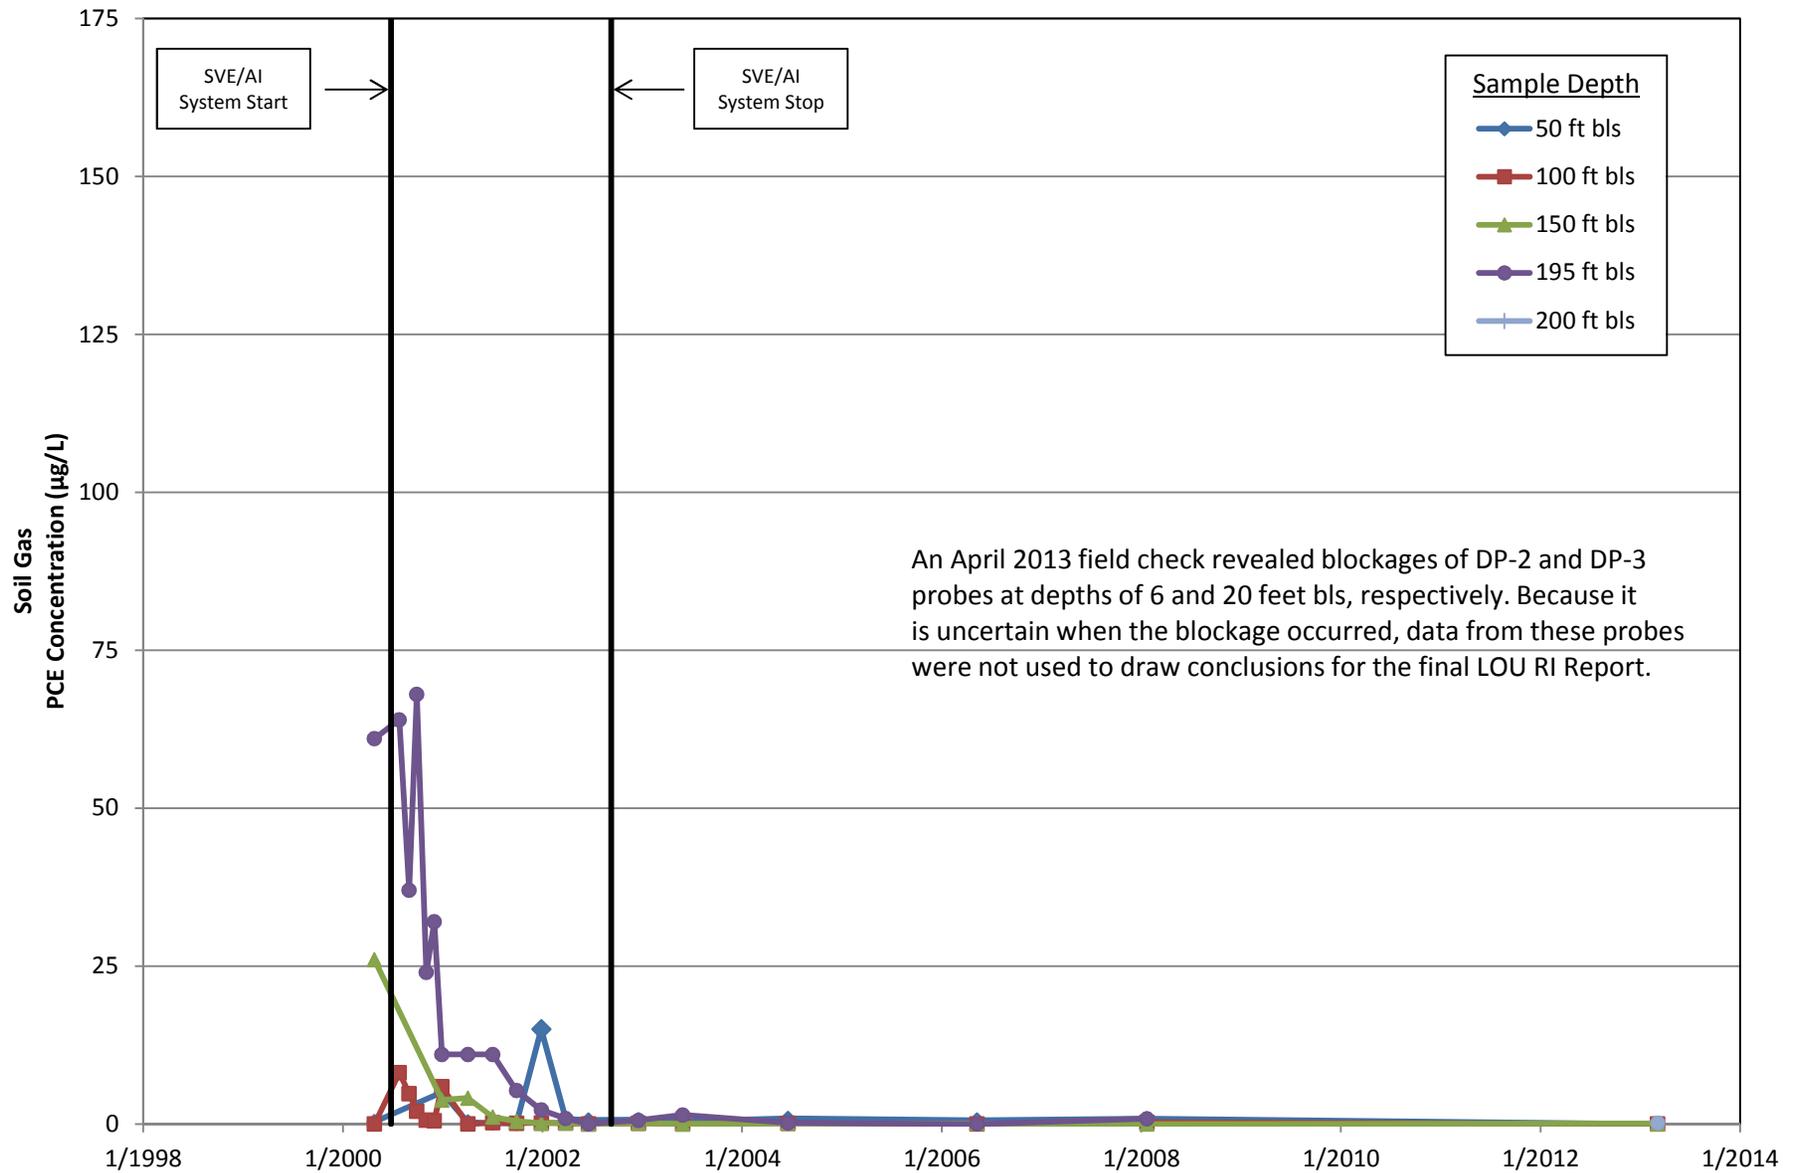

DP-1

The DP-1 probes labeled as 150 feet deep and 193 feet deep were measured to be 191.45 feet deep and 153.95 feet deep respectively. ADEQ surmises that the probes were mislabeled from the beginning. Tables and figures in this report have been revised so that the sample ID reflects the proper probe depth.

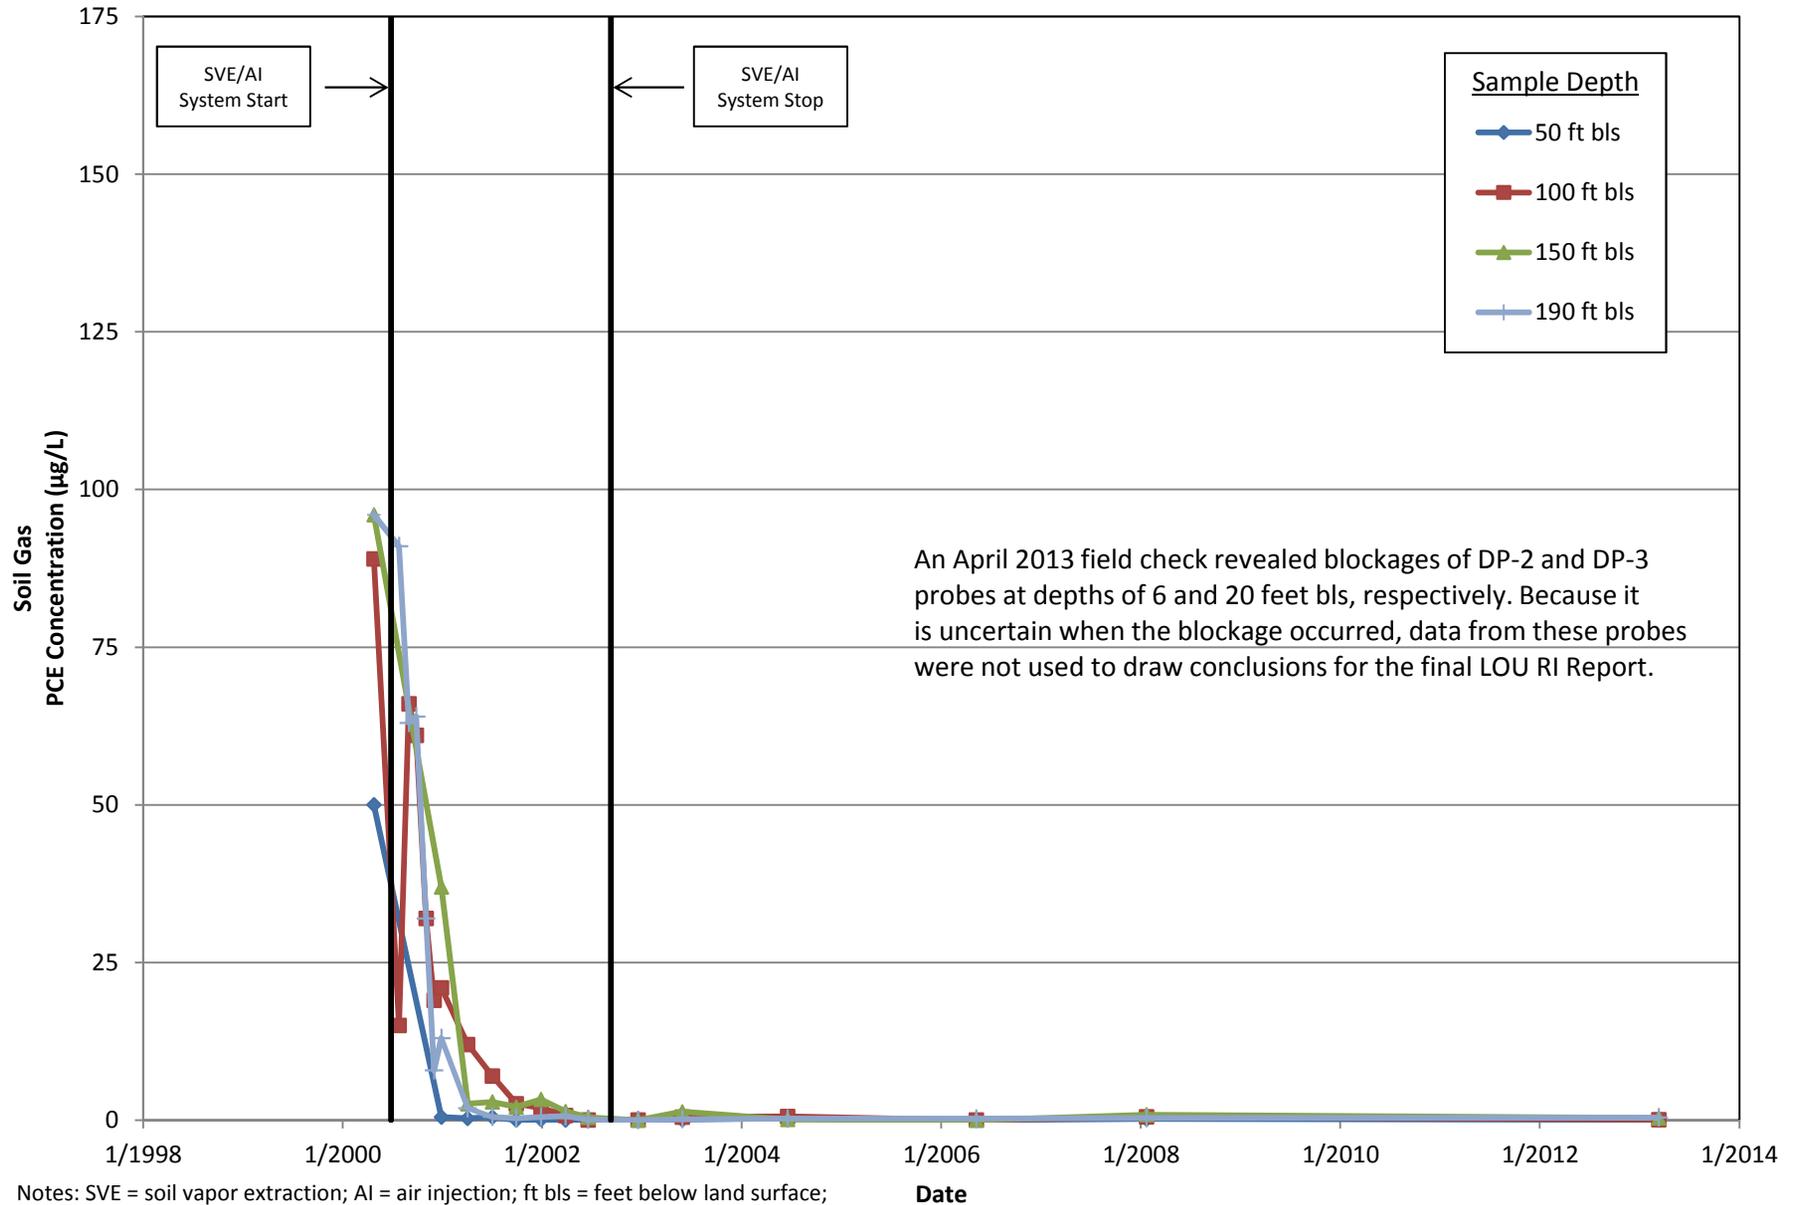

Notes: SVE = soil vapor extraction; AI = air injection; ft bls = feet below land surface; µg/L = micrograms per Liter

Notes:

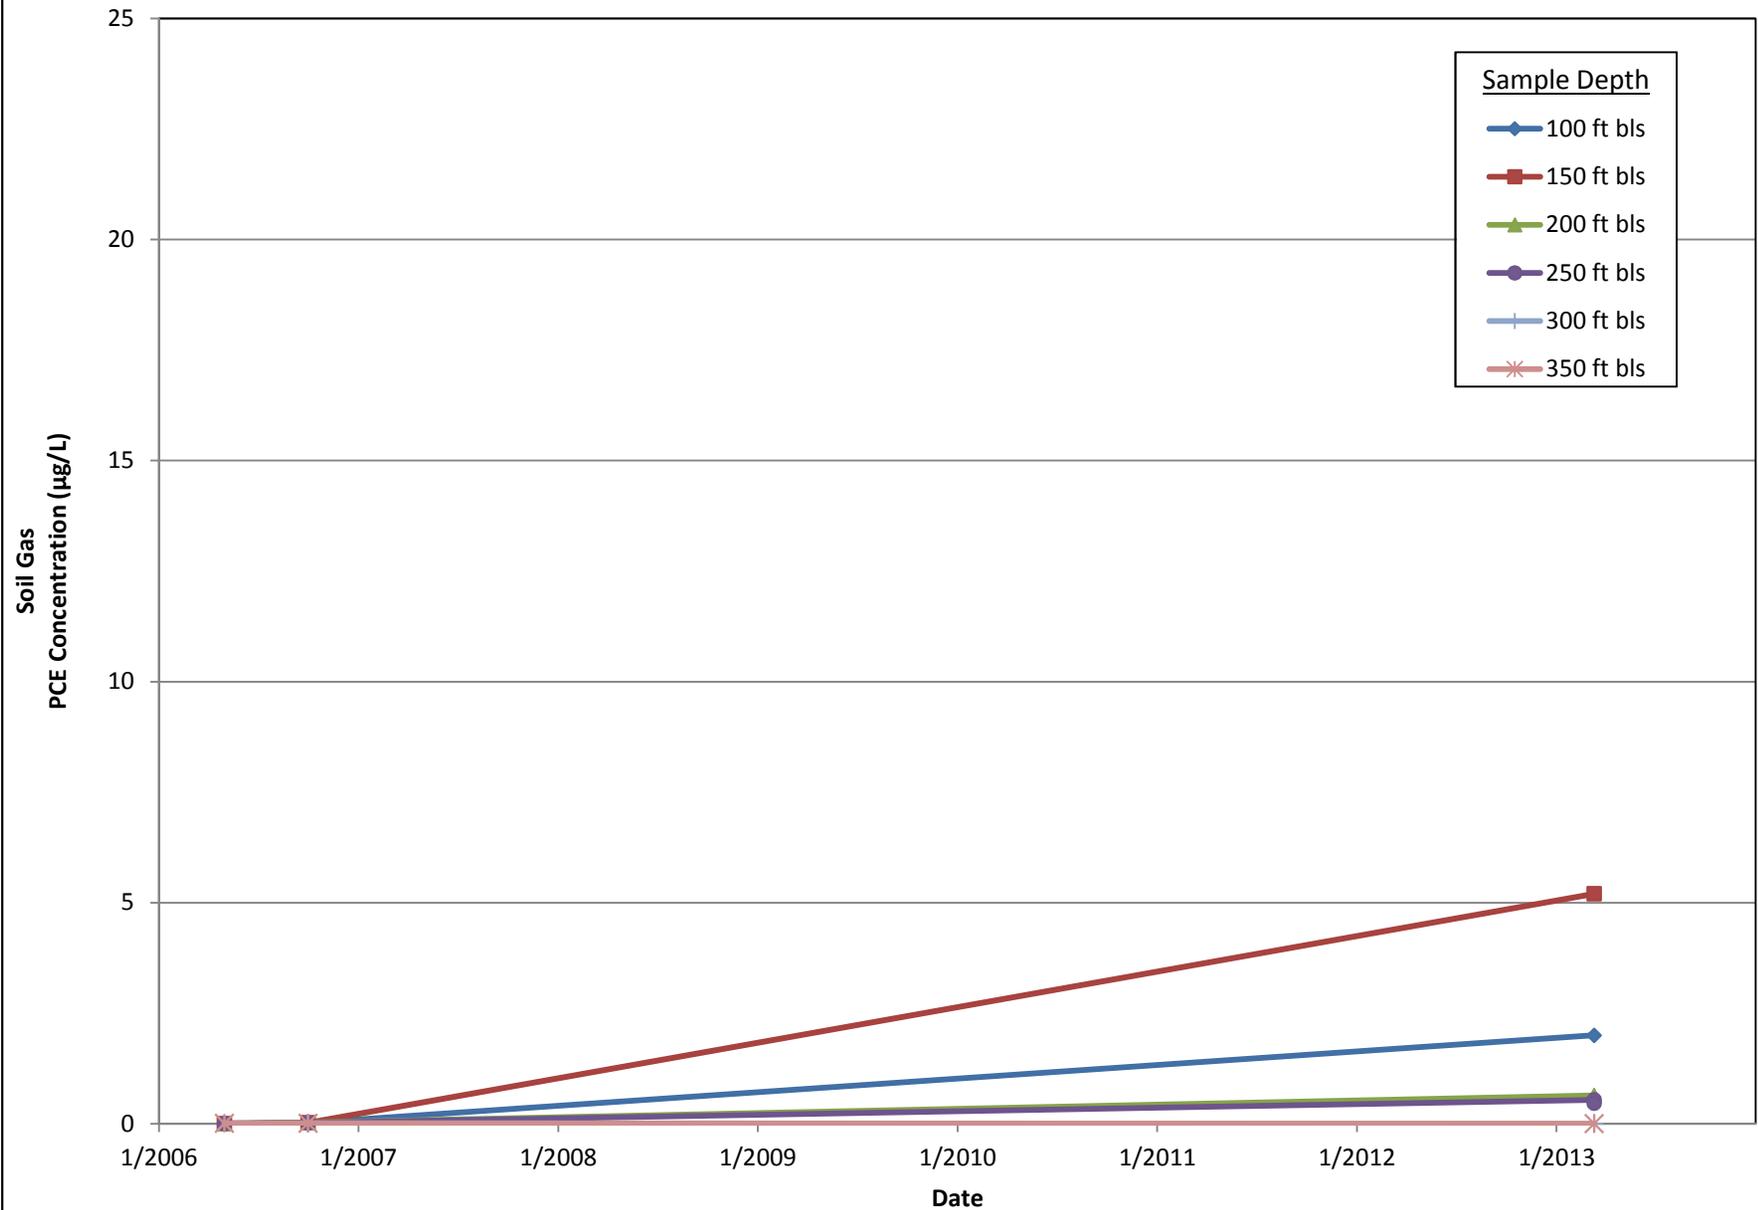

- DUP Duplicate Sample
- mg/m³ milligrams per meter cubed
- NA Not Analyzed
- ND Analyte not detected above reporting limit
- WH wellhead
- < Less than laboratory reporting limit
- Shaded cell indicates detection

There may be a slight discrepancy between the reported value in the laboratory report and the reported value in the data validator's report due to a conversion of the units (from parts per billion (volume) to mg/m³). These differences are very small and do not result in any substantive difference relative to the SRLs.

- 1--The measured depths for DP-1-150' and DP-1-193' soil gas probes were 191.45' bls and 153.95' bls respectively; ADEQ surmises that the probes were mislabeled from the beginning. Tables and figures in this report have been revised so that the sample ID reflects the proper probe depth.
- 2--An April 2014 field check revealed blockages of DP-2 and DP-3 at depths of 6 and 30 feet, respectively, ADEQ surmises htat the probes were mislabeled from the beginning. Tables and figures in this report have been revised so that the sample ID reflects the proper probe depth.
- 3--The sample from WR-274A-300 was collected from the 5-inch diameter well, and the sample from WR-274A-220 was collected from the probe screened at 300 feet bls. These samples were collected from the same filter pack interval. No sample was collected from the probe screened at 220 feet.

Notes:

- DUP Duplicate sample
- mg/m³ Milligrams per meter cubed
- NA Not analyzed
- NS Not sampled
- WH Wellhead

Shaded cell indicates detection

1 Original Sample ID WR-434A-D 50, WR-434A-C 150, WR-434A-B 250, and WR-434A-A 350 changed to WR-434A-50, WR-434A-150, WR-434A-250, and WR-434A-350, respectively.

There may be a slight discrepancy between the reported value in the laboratory report and the reported value in the data validator's report due to a conversion of the units (from parts per billion (volume) to mg/m³). These differences are very small and do not result in any substantive difference relative to the SRLs.

**SUMMARY OF RESULTS FROM CLEAR CREEK ASSOCIATES' APRIL 22-23, 2014
GAUGING OF BROADWAY NORTH LANDFILL AND BROADWAY SOUTH
LANDFILL SOIL GAS PROBES/WELLS 2014 MEMORANDUM, FROM GRETCHEN
WAGENSELLER TO THE BROADWAY-PANTANO WATER QUALITY ASSURANCE
REVOLVING FUND SITE PROJECT FILE, DATED JUNE 18, 2014**

Memorandum

Date: June 18, 2014

SROSPU 14.75

To: Broadway-Pantano Water Quality Assurance Revolving Fund Site Project File

From: Gretchen Wagenseller, ADEQ Project Manager, SRO Superfund Programs Unit

Thru: Scott Green, SRO Superfund Programs Acting Unit Supervisor

Subject: Summary of Results from Clear Creek Associates' April 22-23, 2014 Gauging of Broadway North Landfill and Broadway South Landfill Soil Gas Probes/Wells

The Arizona Department of Environmental Quality (ADEQ) contracted with Clear Creek Associates (CCA) to gauge the depths of the probes in the Broadway North Landfill (BNL) and Broadway South Landfill (BSL) soil gas wells. This gauging was performed based on a February 26, 2014 written comment from the City of Tucson Environmental Services (COT-ES) to ADEQ regarding the Draft Landfill Operable Unit Remedial Investigation Report for the Broadway-Pantano Water Quality Assurance Revolving Fund Site (Final LOU RI Report). COT-ES requested that ADEQ check total depth on all soil vapor probes, especially those installed through refuse, since, over the years, COT-ES had observed settling in some of their wells with nested soil gas probes that was likely compromising the integrity of either the wells and/or the nested vapor probes within the wells. CCA performed this work on April 22-23, 2014 for probes in the following soil gas BNL and BSL wells:

- DP-1
- DP-2
- DP-3
- DP-4
- DP-5
- DP-6
- DP-7
- R-068A
- R-069A
- R-070A
- R-071A
- R-072A
- R-073A
- R-074A
- R-075A
- WR-273A
- WR-274A
- WR-275A
- WR-434A
- BP-22

-
- BP-23
 - BSDP-1
 - BSDP-2
 - BSDP-3
 - BSDP-4

The tabulated results, field notes, and photographs are attached. Results from this well gauging and ADEQ corrective action (with respect to the Final LOU RI Report) are summarized below:

1. The gauging tape could not extend below 6' and 20' in the 50'-, 100'-, 150'-, and 193'- nominal-depth probes in wells DP-2 and DP-3, respectively. This blockage indicates likely structural damage to the well and the soil gas probes that occurred at some time(s) since their installation in 1996. Therefore, with respect to the Final LOU RI Report, these data are not being used in drawing conclusions; these results are noted in the text and the DP-2 and DP-3 data are flagged in the tables and figures.
2. The measured actual total depth of the DP-1-150' well was 191.45' and the measured actual total depth of the DP-1-193' well was 153.95'. These two probes most probably were mislabeled during installation. The Final LOU RI Report (including tables and figures) is revised accordingly.
3. DP-6 could not be gauged due to significant vandalism.
4. Excluding the gauging data from damaged DP-2 and DP-3 soil gas probes, the average deviation of the measured depth from the "nominal" depth for the wells was approximately $\pm 2'$, with the average positive deviation being 2.31' (with 35 well probes having a depth deeper than "nominal" depth) and the average negative deviation being -1.34' (with 17 well probes having a depth shallower than "nominal" depth). These deviations are indicated in the Final LOU RI Report.

The Final LOU RI Report will reflect these results. Because it is uncertain when the damage to DP-2 and DP-3 occurred, data from DP-2 and DP-3 are not being used to draw conclusions for the Final LOU RI Report.

Project Broadway - Pautano
Water Monitoring Probe Sounding

Rite in the Rain - A patented, environmentally responsible, all-weather writing paper that sheds water and enables you to write anywhere, in any weather. Using a pencil or all-weather pen, *Rite in the Rain* ensures that your notes survive the rigors of the field, regardless of the conditions.

the zero point,
074⁵⁴ 54 cm onsite.

0801 Metal tape is only 300ft in length. ~~Probe in casing~~

The metal tape cleared to 300 ft. Now attempting with water level sonder

0807 WL sonder reached further than 300 ft, but less than 350 ft. The rod stuck briefly near "bottom". Close vent, lock vent.

0824 CM, VNH, NML onsite. DB-1 opened with peg 250 ft. Cut off top to 50 ft probe

0832 50th => 51.5 ft to stoppage

0840 150 ft probe open (unscrewed) ~~tape~~ It took, 2 people with pliers and a wrench to unscrew sampling fixture at top of PVC.

0842 190 ft tape passed to 190 ft

0846 125 ft probe is open

0848 Tape passed to 127 ft

0849 190 ft probe open

0851 Passed to 152.5 ft
(* possible the 150 ft and 190 ft probes are mislabeled)

0853 All probes have been reattached to sampling fixture except for the 50 ft probe which has a plastic PVC cap. VNH is tapping the cut off piece of the Probe to the inside of the casing.

0858 CM of site

0900 NML, VNH onsite DP-3

0909 DP-3 opened with 2007 peg 50 ft probe opened -> tape passed to 20 ft *

0910 100 ft probe open

0913 tape passed to 20 ft *

150 ft probe open

0921 190 probe open (the PVC joint lugger fast is loose; needs to be held in place)

Notes in the Room

while unscrewing sampling fixture.

0922 Tape passed to 20ft.

All nested probes in DB-3 were only clear to approximately 20ft from top of PVC.

0925 All sampling were reattached.

0927 Onsite at DB-4, casing open with 2007 key.

0930 50ft probe open, MWL takes photo, VNH receives phone call from Allison Jones (AT) - VNH

0934 updated AT on morning tape clears to 51.5ft

0935 100ft probe open -> clears to 102ft.

0936 150ft probe open -> clears to 152ft.

0939 200ft probe open -> clears to 202ft.

0942 250ft probe open - clear to 253ft.

0946 300ft probe open. -> clear to 300ft -> metal

tape detached from Feeder, and the tape fell into the ~1-inch inner diameter PVC 300" probe.

0951 VNH pruned update to AT - DB-4 vault locked and secured after reattaching sampling fixture. MWL and VNH will

continue to check clearance in the Vapor probe with the electronic water level sonder. Cup PVC is large enough diameter. MWL, VNH offsite to authorize to purchase a high powered rare earth element magnet.

NOTE: Fence to Broadway North Landfill (BNL) has the top hinge detached on the right side. Also the third number on lock was jammed upon

Return the Rain

4/22/14

arrival this morning. VNH was able to unjam it, but it is still "sticky".

1117 MML, VNH onsite at DP-4 after purchasing magnets, bolt, nut and twine from Home Depot. Now taping magnets to bolt and twine to lower down 300' Probe in an attempt to ^{VNH} retrieve metal measuring tape.

1131 First set up did not work. The top of the tape is only ~5ft below the top of the PVC, but the tape is not getting picked up by the magnets. The magnets stick to the well vault and to the feeder however, the magnets only slightly attach to the inner ring that the tape attaches to. It is possible the metal alloy tape is not very magnetic.

4/22/14

MML-7

1148 VNH reattaching magnets awkwardly along twine (instead of stacked at end). MML attached duct tape to tape measure, but was only able to raise metal tape a few inches before it would detach.

1158 Metal tape has been successfully retrieved from probe.

1208 MML, VNH reattaches metal tape to feeder, adding electrical tape along the inner ring for added security.

1212 VNH phones update 4/21/14.

1236 Unlock WR-275A probes in good condition at surface

1239 Unscrew 50ft probe
 → Clears to 50ft.
